SERVICE MANUAL

IMPORTANT NOTICE

This manual has been provided for the use of authorized YAMAHA Retailers and their service personnel. It has been assumed that basic service procedures inherent to the industry, and more specifically YAMAHA Products, are already known and understood by the users, and have therefore not been restated.

WARNING: Failure to follow appropriate service and safety procedures when servicing this product may result in personal injury, destruction of expensive components, and failure of the product to perform as specified. For these reasons, we advise all YAMAHA product owners that any service required should be performed by an authorized YAMAHA Retailer or the appointed service representative.

IMPORTANT: The presentation or sale of this manual to any individual or firm does not constitute authorization, certification or recognition of any applicable technical capabilities, or establish a principle-agent relationship of any form.

The data provided is believed to be accurate and applicable to the unit(s) indicated on the cover. The research, engineering, and service departments of YAMAHA are continually striving to improve YAMAHA products. Modifications are, therefore, inevitable and specifications are subject to change without notice or obligation to retrofit. Should any discrepancy appear to exist, please contact the distributor's Service Division.

WARNING: Static discharges can destroy expensive components. Discharge any static electricity your body may have accumulated by grounding yourself to the ground buss in the unit (heavy gauge black wires connect to this buss).

IMPORTANT: Turn the unit OFF during disassembly and part replacement. Recheck all work before you apply power to the unit.

■ TO SERVICE PERSONNEL

1. Critical Components Information.
Components having special characteristics are marked \triangle and must be replaced with parts having specifications equal to those originally installed.
2. Leakage Current Measurement (For 120V Models Only).
When service has been completed, it is imperative to verify that all exposed conductive surfaces are properly insulated from supply circuits.
 - Meter impedance should be equivalent to 1500 ohm shunted by 0.15 μ F.
 - Leakage current must not exceed 0.5mA.

- Be sure to test for leakage with the AC plug in both polarities.

“CAUTION”

“F751 : FOR CONTINUED PROTECTION AGAINST RISK OF FIRE, REPLACE ONLY WITH SAME TYPE 12A, 250V FUSE.”

CAUTION

F751 : REPLACE WITH SAME TYPE 12A, 250V FUSE.

ATTENTION

F751 : UTILISER UN FUSIBLE DE RECHANGE DE MEME TYPE DE 12A, 250V.

● Starting DIAG

For DSP-AX1:

Press the “POWER” (STANDBY/ON) key of the main unit while pressing the “SET MENU+” key and the “NEXT” key located in the sealing panel of the main unit, and DIAG will be activated.

For RX-V1:

Press the “POWER” (STANDBY/ON) key of the main unit while pressing the “PROGRAM ▷” key and the “EFFECT” key located in the sealing panel of the main unit, and DIAG will be activated.

● Starting DIAG in the protection cancel mode

If the power supply, amplifier protection function is activated and hinders the trouble diagnosis, cancel the protection function as described below, and it will be possible to enter the DIAG mode. (The protection function other than the excess current detect function will be cancelled.)

For DSP-AX1:

Press the “POWER” (STANDBY/ON) key while pressing the “SET MENU+” key and the “NEXT” key. At this time, keep pressing the “SET MENU+” key and the “NEXT” for 3 seconds or longer.

For RX-V1:

Press the “POWER” (STANDBY/ON) key while pressing the “PROGRAM ▷” key and the “EFFECT” key. At this time, keep pressing the “PROGRAM ▷” key and the “EFFECT” key for 3 seconds or longer.

In this mode, “ ” in the FL display of the main unit flashes.

CAUTION!

Using this product with the protection function cancelled may cause damage to itself. Use special care for this point when using this mode.

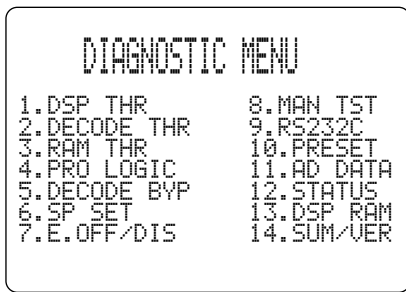

● Canceling DIAG

Turn off the power by pressing the “POWER” (STANDBY/ON) key of the main unit or the “STANDBY” key of the remote control unit.

CAUTION: When canceling this function, check that DIAG menu No.10 PRESET (memory initialization inhibited/reserved) has been set. (To keep the user memory, be sure to select “INHIBIT” (initialization inhibited) from the No.10 PRESET menu before canceling the DIAG function.)

● Display at the start of DIAG

The diagnostic menu appears on the monitor screen. (It remains on display until it is canceled.)

On the FL display of the main unit, an opening message (including the version and the history of protection function) appears for a few seconds followed by the diagnostic menu display of 1 DSP THROUGH: ANALOG BYPS.

Opening message

When there is no history of protection function (*1)

Version of the main/sub microprocessor (1 alphabet)

Checksum of the main microprocessor

Checksum of the sub microprocessor

Checksum (4 figures consisting of alphabets and numbers)

The checksum is obtained by adding 4M bits per 1 octo of the entire program code and expressing the result as a 4-figure hexadecimal data. (0xff is added for the area where no code has been entered and for the area other than ROM code.)

DIAG menu display

(*1) If the history of the protection function has been recorded, the type of the protection function and the voltage value recorded last are displayed.

In the case where the protection function works after DIAG has been started and the power is turned off ;
 When the protection function (*2) works, the history of the protection function appears on display and the power turns off. Repair the faulty parts according to the displayed history.

(*2) When an excess current or any other faulty condition is found with the power source, DC, etc., the protection function forces the power to turn off.

I PROTECTION display

(When the power is turned on without an abnormality corrected, the protection function works the moment the power relay is turned on to shut off the power supply.)

Cause: There is an abnormal current flow to the power amplifier.
Supplementary information: If I PROTECTION function has worked after SP relay ON, a warning message "CHECK SP WIRES" appears the next time the power is turned on. This indicates that some trouble exists after the SP terminal, such as a short-circuit of the speaker cable.

PS PRT display

(When the power is turned on without an abnormality corrected, the protection function works about 1 second later to shut off the power supply. Display may not be provided, if there is an abnormality with the power supply for the display.)

Cause: There is an abnormality in the power supply section (voltage).
Supplementary information: As the power from following sources is detected, it is possible to determine where an abnormality exists.

TMP PRT display

(When the power is turned on without an abnormality corrected, the protection function works about 3 seconds later to shut off the power supply.)

Cause: The temperature of the heat sinks in the power amplifier is detected. When the temperature rises and an abnormality is detected, the power turns off.

Besides the above possible causes, the cause may exist in the disconnected connector or around CPU. PS PRT, DC PRT and TMP PRT displays include the abnormal A/D value in % (voltage value obtained by considering 5V as 100%). Concerning this value, refer to DIAG menu No.11 FAN/AD described on page 28.

● History of protection function
 When the protection function has worked, its history is stored in memory with a backup. Even when no abnormality is noted while the unit is being serviced, an abnormality which has occurred previously can be defined as long as the backup data has been stored.
 The protection history is cleared when DIAG is canceled by selecting "RESERVED" (memory initialization) from the setting items of the DIAG menu No.10 PRESET or when the backup data is erased.

● **Operation procedure of DIAG menu and SUB-MENU**

There are No.1 to No.14 MENU items and some SUB-MENU items as well.

DIAG menu selection

9. RS-232C

This menu is used to check transmission of the data and the flow port of the hardware. With the power turned off, short between pins No.2 (RxD) and No.3 (TxD) and between pins No.7 (RTS) and No.8 (CTS) of the RS-232C terminal. (Be sure to turn off the power when shorting pins.) Start DIAG and select the menu. There are two sub-menu items. The signals are processed in the same way as EFFECT OFF under item 4. PRO LOGIC. (The L/R signals are output using ANALOG MAIN BYPASS.)

```
9. RS-232C
   TxD/RxD DATA:XX
```

TxD/RxD DATA

This sub-menu is used to check transmission of the test data. "OK" appears when the data is transmitted properly and "NG" when it is not. In this mode, NULL command transmission is continued after the test command is transmitted.

```
9. RS-232C
   HARD FLOW :XX
```

HARD FLOW

This sub-menu is used to check operation of the flow port of the hardware. "OK" appears when the check result is satisfactory and "NG" when it is not.

10. PRESET

This menu reserves and inhibits initialization of the back-up RAM (parameter, set menu contents, etc. for the sound field program). The input signals are automatically identified in the priority order of AC-3 > PCM > Analog. The signals are processed in the same way as EFFECT OFF of No.4.

10. PRESET INHIBIT

INHIBIT (Initialization inhibited)

RAM initialization is not executed. Select INHIBIT to protect the values set by the user.

10. PRESET RESERVED

RESERVED

Initialization of the back-up RAM is reserved and it is executed when the power is turned ON after canceling DIAG. RESERVED should be selected when shipping out of the factory or resetting RAM.

CAUTION : Before setting to the PRESET RESERVED, write down the existing preset memory content of the Tuner in a table as shown below. (This is because setting to the PRESET RESERVED will cause the user memory content to be erased.) (RX-V1 only)

13. DSP RAM CHECK

This menu is used to self-diagnose whether or not the external RAM (IC33, 34, 35) and DSP (IC7, 8) are connected properly, utilizing the CPU -Ext. RAM interface function included in DSP6. During signal processing, the status before execution of this menu is maintained.

```
13.DSP RAM CHECK
#1:NoEr #2:NoEr
```

#1, #2

Checks the address bus and the data bus of DSP#1 (IC7 of DSP circuit board) and DSP#2 (IC8 of DSP circuit board), and indicates the connection condition. "NoEr" appears when no error is detected.

When an error is detected in the data bus;

1619 (example): Indicates that there is an incorrect value between bits 16 and 19. If there are two or more incorrect values, priority is placed on the LSB side.

When an error is detected in the address bus;

Ad01 (example): Indicates that the address bit 1 has an error.

Ad17 (example): Indicates that the address bus bit 17 has an error. (With this product, however, it is possible that A8 and /OE are short-circuited.)

- Note that a bus error may be indicated also when there is an error with the terminal other than above buses.
- Detection for the bus check is executed immediately after resetting. An error which has occurred after starting DIAG cannot be detected.

14. SUM/VER /PORT

There are four sub-menu items.

Indicates the checksum, version, port of the main microprocessor (IC27 of the function circuit board) as well as the checksum and version of the sub-microprocessor (IC1 of the DSP circuit board).

The signals are processed in the same way as EFFECT OFF under item 4. PRO LOGIC. (The L/R signals are output using ANALOG MAIN BYPASS.)

CAUTION : When replacing the microprocessor, be sure to check the microprocessor compatibility before replacement. The microprocessor may not be suitable for replacement depending on its communication format. Use of a microprocessor whose communication format is not compatible with the existing one will cause some communication error between microprocessors.

```
14.SUM/VER/PORT
M:51F5 / S:A3BB
```

Checksum of main/sub microprocessor

Checksum: The checksum is obtained by adding 4M bits per 1 octo of the entire program code and expressing the result as a 4-figure hexadecimal data. (0xff is added for the area where no code has been entered and for the area other than ROM code.)

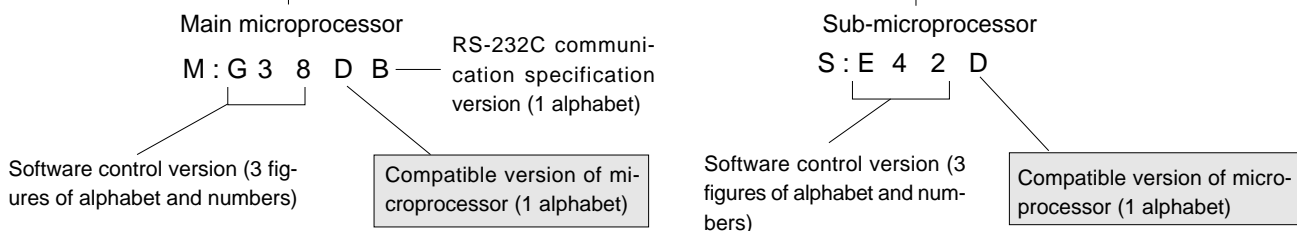

Checksum of sub-microprocessor
(4 figures of alphabets and numbers)

Checksum of main microprocessor
(4 figures of alphabets and numbers)

```
14.SUM/VER/PORT
M:G38DB/ S:E42D
```

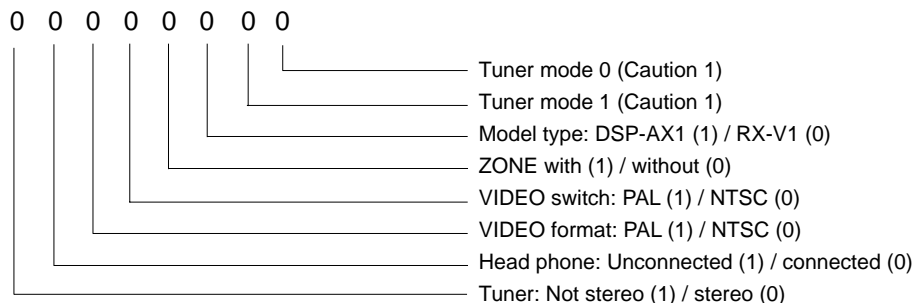

**Software version/compatible version/RS-232C version of main microprocessor
Software version and compatible version of sub-microprocessor**

The alphabet of the compatible version represents the communication format compatibility between the main and sub microprocessors. If the alphabet representing the communication format compatibility agrees, the microprocessors are interchangeable. If the alphabet is different, the replacement microprocessor will fail to function properly.
