

Display/Decode/Logic control PCB Pt No

To eliminate the untidy scratched film and bulb polarity indicator specified in the original article we have adapted this PCB to use a 3015g tube. This is identical in appearance to the 3015f but has a plus, minus and one instead of the normal seven segment format of the 3015c. This tube is of course used in the 'thousands' digit position. A modification is required to the '9 to 16' sub-board for this digit only as shown below.

ON 3015G ONLY !!

The component marked 'opt 47uf' is a supply decoupling capacitor which has proved to be unnecessary and is not included in the kit.
