

# SERVICE MANUAL

14" , 20" AUTO—TRACKING  
COLOR DISPLAY MONITOR

MODEL FA34 SERIES

HA39 SERIES

MITUBISHI ELECTRIC CORPORATION

JULY 1988 Rev. A

## X - RADIATION WARNING

The surface of picture tube may generate X - Radiation.

Precaution during servicing, and if possible use of a lead apron or metal for shielding is recommended. To avoid possible exposure to X - radiation and electrical shock hazard, the high voltage compartment and the picture tube shield must be kept in place whenever the chassis is in operation. When replacing picture tube use only designated replacement part since it is a critical component with regard to X - Radiation as noted above.

The high - voltage specification is described on page 2.

## CRITICAL COMPONENT REPLACEMENT WARNING

The components marked "  " are critical components for X - ray radiation. When replacing these parts, use exactly the same one indicated in parts list.

Please do not remove the seal of sealed potentiometer.

If broken the critical component, please contact with qualified personnel of Mitsubishi Electric Corp. or the company which indicated on name plate.

## 注 意

本品は外国為替及び外国貿易管理法に定める戦略物資（又は役務）に該当するため、輸出する場合、同法に基づく輸出（又は役務取引）許可が必要です。

## CAUTION

These products or technologies are subject to Japanese and/or COCOM strategic restrictions, and diversion contrary thereto is prohibited.

# 1. SPECIFICATION

## 1.1 FEATURES

### 1) FULL COMPATIBLE TO THE IBM P.C. :

The size and position of the picture to operate the IBM system (8514A personal system/2 of 3 line mode and EGA /CGA each boards) is automatically adjusted at the click center of knobs on the front panel of the unit.

In addition, manual adjustment to the other computer such as APPLE II GS and MAC II can be available with the knobs.

### 2) VIDEO SIGNAL CAN BE INPUT ON A D-SUB AND BNC CONNECTOR :

RGB TTL separate (8 colors), RGBI TTL separate (16 colors pastel/saturation), RGB R'G'B' TTL separate (64 colors) and RGB analog signals can be input to D-SUB connector for FA34 and HA39 series. Also, RGB analog signal can input to BNC connector for FA3425 and HA3905 series. In addition, TTL text mode can be used by switched to text position.

### 3) AUTO-TRACKING FUNCTION :

Automatically tracking and synchronization over a wide range of horizontal (15.7-35.5KHz) and vertical (50-87Hz) scanning frequencies can be displayed correctly in the screen of monitor by the auto-tracking function, without any adjustment.

### 4) NORMAL AND WIDE SCAN :

The normal scan and wide scan selection for convenient picture size and position adjustment can be select the "SCAN MODE" switch. The selection function is available in a horizontal scanning range of 15-25KHz.

## 1.2 ELECTRICAL SPECIFICATIONS FOR FA34 SERIES

### 1) CRT DESCRIPTION

(1) Size	: 14 inch diagonal (13"V)
(2) Deflection angle	: 90 degree diagonal
(3) Electron gun	: In-line type
(4) Focusing method	: Electrostatic
(5) Convergence method	: Magnetic
(6) Mask type	: Black matrix
(7) Trio spacing	: 0.28mm
(8) Array	: Dot trios
(9) Phosphor type	: B22/BL9
(10) Phosphor persistence	: Medium-short/Long
(11) Face plate	: Tinted glass (STD)
(12) Surface treatment	: Non-glare (STD)
(13) Implosion protection	: Banded with mounting lugs

### 2) POWER SUPPLY

	※ 100-120VAC(90~132VAC)/220-240VAC(198~264VAC)
(1) Voltage	: AC120V (90~132V) /AC220-240V ± 10 %
(2) Frequency	: 50/60Hz (± 1Hz)
(3) Power consumption	: 90Watts (Max.)
(4) Inrush current	: less than 50A (0-peak)
(5) AC leakage current	: less than 750 μA (measured by IEC-380)

※ FA3435 (TAP SELECTABLE)

### 3) SIGNAL INPUT

#### (1) Analog video input (R.G.B channels)

- Input voltage : 0.7Vp - p (0.5~2.0Vp - p available)
- Input impedance : 75ohm to GND
- Signal polarity : Positive white

#### (2) TTL video input (R.G.B.I or R. R'.G'.G'.B.B')

- Input voltage : 0.0 to 0.4V Low level  
: 2.7 to 5.0V High level
- Input impedance : 330ohm to GND
- Signal polarity : Positive white

#### (3) Separate/Composite sync.

- Input voltage : 0.0 to 0.4V Low level  
(TTL) : 2.7 to 5.0V High level
- Input impedance : 1kohm to GND
- Signal polarity : Positive/Negative

#### (4) Composite sync. on Green of Analog video signal

- Input voltage : 0.3Vp - p (sync.) 0.7Vp - p (Video)
- Input impedance : 75ohm to GND
- Signal polarity : Negative

#### (5) Others

The MODE signal (TTL) of PGA is allowed to input when the PGA mode is detected in "PRESET" mode.

### 4) DEFLECTION

#### (1) Horizontal

Automatic synchronization : 15.7KHz - 35.5KHz

#### (2) Vertical

Automatic synchronization : 50Hz - 87Hz

### 5) HIGH VOLTAGE

High voltage at CRT anode : 23.0KV  $\pm$  1.0KV  
(At Beam current 400  $\mu$  A)

### 6) DEGAUSSING

Automatic degaussing : Activated at power on.

## 1.3 ELECTRICAL SPECIFICATIONS FOR HA39 SERIES

### 1) CRT DESCRIPTION

- (1) Size : 20 inch diagonal (19"V)
- (2) Deflection angle : 90 degree diagonal
- (3) Electron gun : In-line type
- (4) Focusing method : Electrostatic
- (5) Convergence method : Magnetic
- (6) Mask type : Black matrix
- (7) Trio spacing : 0.31mm
- (8) Array : Dot trios
- (9) Phosphor type : BL9 (or B22)
- (10) Phosphor persistence : Long (or short)
- (11) Face plate : Gray (73 %)
- (12) Surface treatment : Non-glare (DM coating)
- (13) Implosion protection : Banded with mounting lugs

### 2) POWER SUPPLY

- (1) Voltage : AC100 - 120V (AC90~132V)  
AC220 - 240V (AC198~264V) Switchable
- (2) Frequency : 50/60Hz ( $\pm 1$ Hz)
- (3) Power consumption : 105Watts (Max.)
- (4) Inrush current : less than 50A (0 - peak)
- (5) AC leakage current : less than 3.5mA (measured by IEC - 380)

### 3) SIGNAL INPUT

- (1) Analog video input (R.G.B channels)
  - Input voltage : 0.7Vp - p (0.5~2.0Vp - p available)
  - Input impedance : 75ohm to GND/High switchable
  - Signal polarity : Positive white
- (2) TTL video input (R.G.B.I or R. R'.G.G'.B.B')
- Input voltage : 0.0 to 0.4V Low level  
: 2.7 to 5.0V High level
  - Input impedance : 330ohm to GND
  - Signal polarity : Positive white
- (3) Separate/Composite sync.
  - Input voltage : 0.0 to 0.4V Low level  
(TTL) : 2.7 to 5.0V High level
  - Input impedance : 1kohm to GND
  - Signal polarity : Positive/Negative
- (4) Composite sync. on Green of Analog video signal
  - Input voltage : 0.3Vp - p (sync.) 0.7Vp - p (Video)
  - Input impedance : 75ohm to GND
  - Signal polarity : Negative

(5) H - SYNC SIGNAL

• Line time : 28.2~64  $\mu$  s  
• BLK. time : 5.1  $\mu$  s min  
• Sync pulse width : 1~7  $\mu$  s

(6) • FRAME TIME

: 11.5~20ms  
• Back Porch : 0.62ms min  
• Sync Pulse Width : 50~300  $\mu$  s (COMP.SYNC.)

4) DEFLECTION

(1) Horizontal

Automatic synchronization : 15.7KHz - 35.5KHz

(2) Vertical

Automatic synchronization : 50Hz - 87Hz

5) HIGH VOLTAGE

High voltage at CRT anode : 25.5KV  $\pm$  1.0KV 450  $\mu$  A

6) DEGAUSSING

Manual degaussing : Activated at degauss SW on.

## 2. CIRCUIT DESCRIPTION

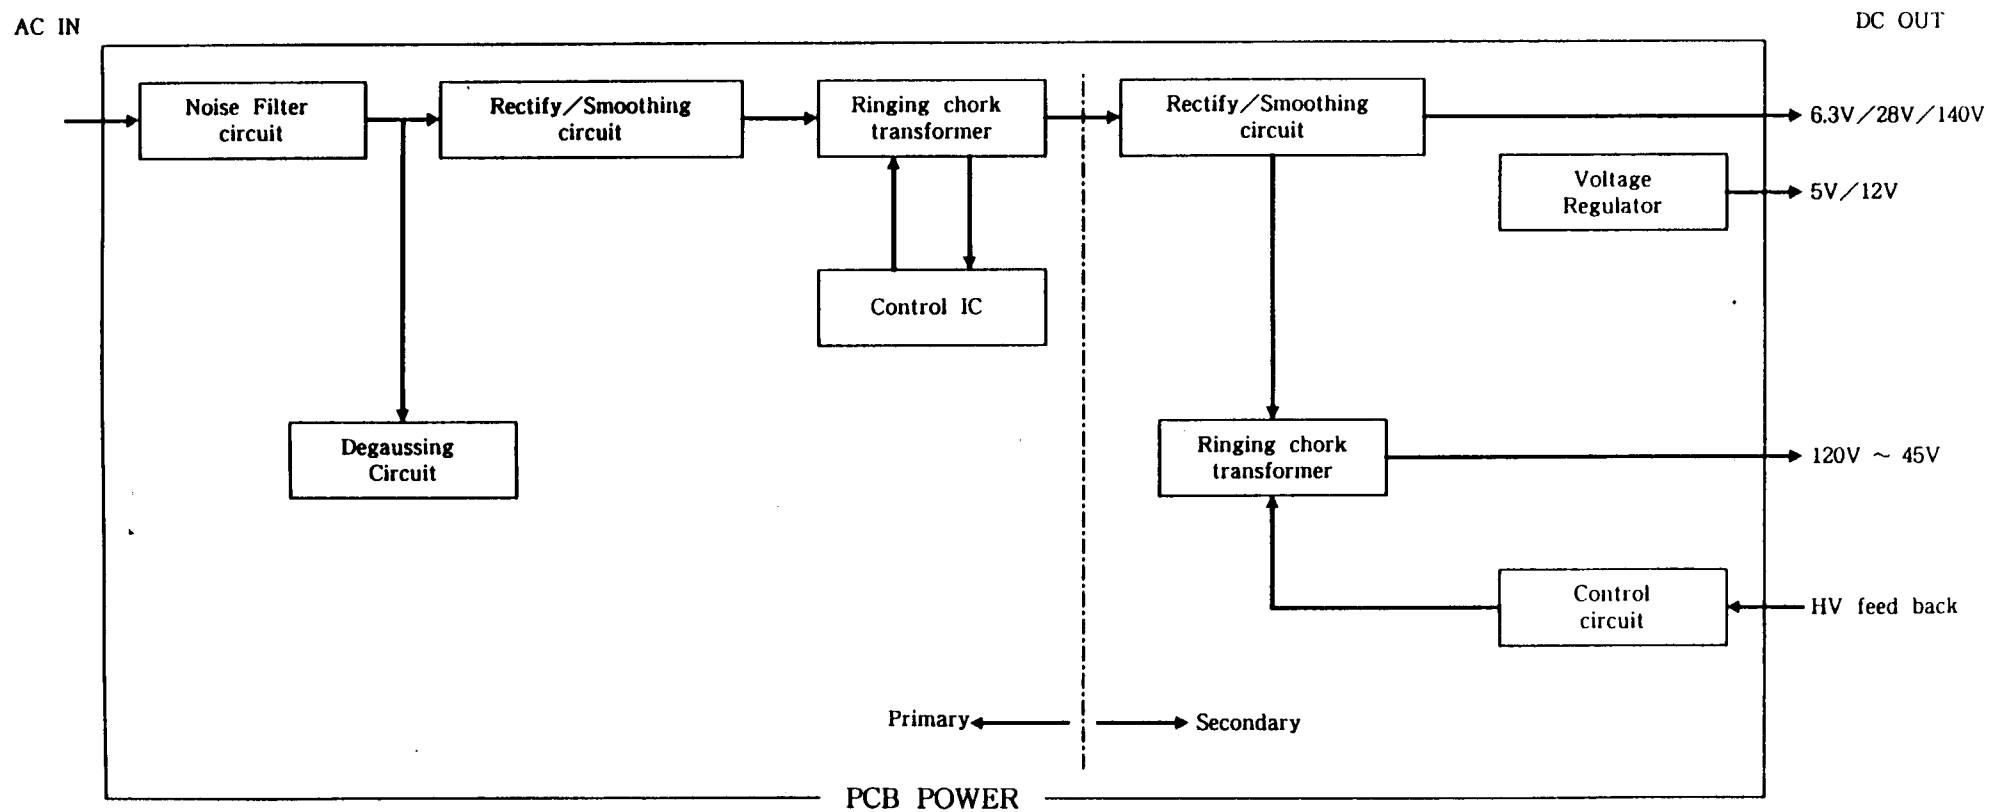

### 2.1 POWER SUPPLY

#### 1) GENERAL

- (1) 100 - 120VAC (220 - 240VAC)  $\pm 10\%$  50/60Hz
- (2) The primary circuit of power supply is operated by RCC (Ringing Chork Converter) method.
- (3) The secondary circuits produce to the following voltage which applied to each load.
- (4) The power supply line 120~45V for anode voltage and horizontal deflection are produced by PWM (Pulse Width Modulation) method which switched from 140V line.

VOLTAGE LINE	ACTUAL OUTPUT VOLTAGE	MAIN LOAD
140V	140V	Horizontal output transistor drive
	120V ~ 45V	Anode/Horizontal Deflection power supply
28V	28V	Vertical deflection and horizontal tracking
15V	12V	Video amp. Vertical tracking
	5V	Control circuit with MPU/Gate array
6.3V	6.3V	CRT heater

# BLOCK DIAGRAM OF POWER SUPPLY CIRCUIT

## 2) NOISE FILTER/RECTIFY/SMOOTHING CIRCUIT

- (1) The noise filter circuit is operate to reduce the noise from both side of the internal or external of monitor.
- (2) The AC input voltage is rectified by the diodes D901 - D904.  
The rectified voltage is smoothed by capacitor C906.
- (3) The thermistor TH901 and TH902 suppress the inrush current when turning ON.

## 3) DEGAUSSING CIRCUIT

This monitor has the degaussing circuit which composed by degaussing coil and posistor RP901.

When the turning ON, posistor of RP901 has small resistance which increase after go through the degaussing current so that it prevent the magnetizing from environmental magnetic field. The re - degauss operation needs a cooling time of RP901 which about 5min.

## 4) RCC & CONTROL CIRCUIT

- (1) When the AC input voltage applied to power supply circuit, starting current go through R905 and R909 which produce to the ② pin of IC991.  
So the collector current of IC991 between ③ pin and ④ pin inflow from the primary side of ⑧, ⑥ pin on the transformer of T931.
- (2) Above collector current induce to the energy on ① pin of T931 which produce the current go through the C908, R904, D906 and R903 to ② pin of IC991.  
As the result, IC991 is operated to ON so that collector current of ③ pin increase.
- (3) When the above collector current reached to  $I_c = I_b \times h_{fe}$ ,  $V_{ce}$  of power transistor in IC991 increase quickly. The applied voltage between ⑧ and ⑥ pin of T931 increase to same value as  $V_{ce}$  of ③ and ④ on IC991, then ② pin of IC991 is reverse biased.  
As result, IC991 operate to completely off.
- (4) After above operation, IC991 is re - started by leakage current of T931 so that switching operation is keeping on.
- (5) If over current inflow to R908 from the primary winding of T931, Q901 turn to ON then switching operation is stopping.

## 5) CHOPPER & CONTROL CIRCUIT FOR SECONDARY

### 5) - 1 CHOPPER CIRCUIT

- (1) When the secondary line of 140V is applied from ④ pin of T931, the starting current produce to base of Q951 through R954, then collector current begin to increase.
- (2) Above current induce the voltage on ⑤ pin of T951.  
The induced voltage produce to the base drive current of Q951 through C970, R956, C969 and R955.
- (3) When the collector current of Q951 reached to  $I_b \times h_{fe}$ ,  $V_{ce}$  of Q951 increase quickly and reverse biased so that Q951 is completely turning OFF.
- (4) When Q951 is turning ON, the load current is supplied from ① and ④ pin of T951 through Q951 and then this current induce the energy to ⑤ and ⑧ of T951, but it blocked by D955.  
When the Q951 is turning OFF, above charged energy is discharged from ⑤ pin of T951 which produce to the load current.  
At this time, C969 is charged through D958 by discharged energy from ⑤ pin of T951 which produce to the base current of Q951 during the turning ON time of Q951.
- (5) The voltage of ② and ③ pin on T931 is use for reference voltage which value is - 41V.  
This voltage is controled by IC991, so the power supply line of secondary circuit is adapt

to the load condition.

- (6) The power supply circuit have the over current protection circuit.

If over current inflow to the ③, ④ pin of IC991, the voltage of R908 increase to more than 0.7V which increase the collector current of Q901.

The result of this operation reduce to base current of ② pin on IC991 so that transistor between ③ and ④ pin in IC991 is turn to off.

- (7) After discharged magnetical energy, this switching operation is keeping on by leakage current of T951.
- (8) Output voltage of Q951 is controled by PWM method which controled to base current of Q951 by Q952.

#### 5) -2 CONTROL CIRCUIT

The reference voltage of control circuit is made by zenner voltage of D956 which compared with feed backed voltage from flyback transformer by error amplifier of Q954, Q953., Q952.

This voltage control to base current of Q951 which is stabilized to anode voltage by PWM method.

## 2.2 DEFLECTION

1) H - HOLD

The horizontal sync. pulse with positive polarity is applied to mono stable multi vibrator of IC502 which get the constantly pulse width according as each frequency.

After above operation, this pulse is converted to DC voltage by Q580 and C584.

Converted DC voltage is converted to DC current by Q581 and Q582 which charge to the apacitor C510.

When the voltage of C510 reached to enough value, it connect to the discharge circuit by IC501.

The concerning with collector current  $I_c$  of Q582, capacitor C of C510, voltage V of C510 and charge Q of C510 can be calculated by following formula

$$Q = \int i dt$$

$$Q = Ict$$

$$V = Q/C = I_c \cdot t/c$$

In this formula, more higher frequency make the more increased  $I_c$ , so that charge and discharge time  $t$  decrease which increase the free running frequency.

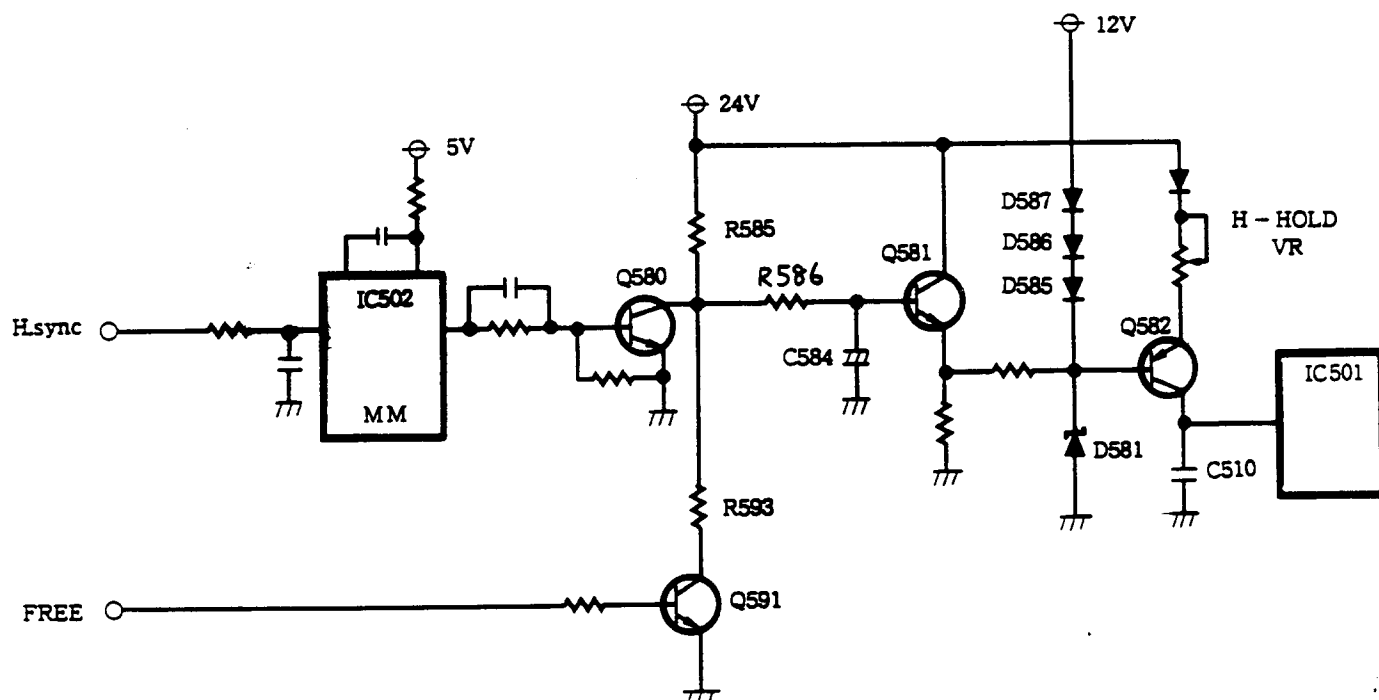

Normaly, base of Q591 is keep on low level, then base voltage of Q581 is applied from Q580.

In case of no signal, the base of Q591 keep on high level via video circuit, then base voltage of Q581 is fixed by R585 and R593.

As the result, above fixed voltage keep the free running frequency as about 25KHz.

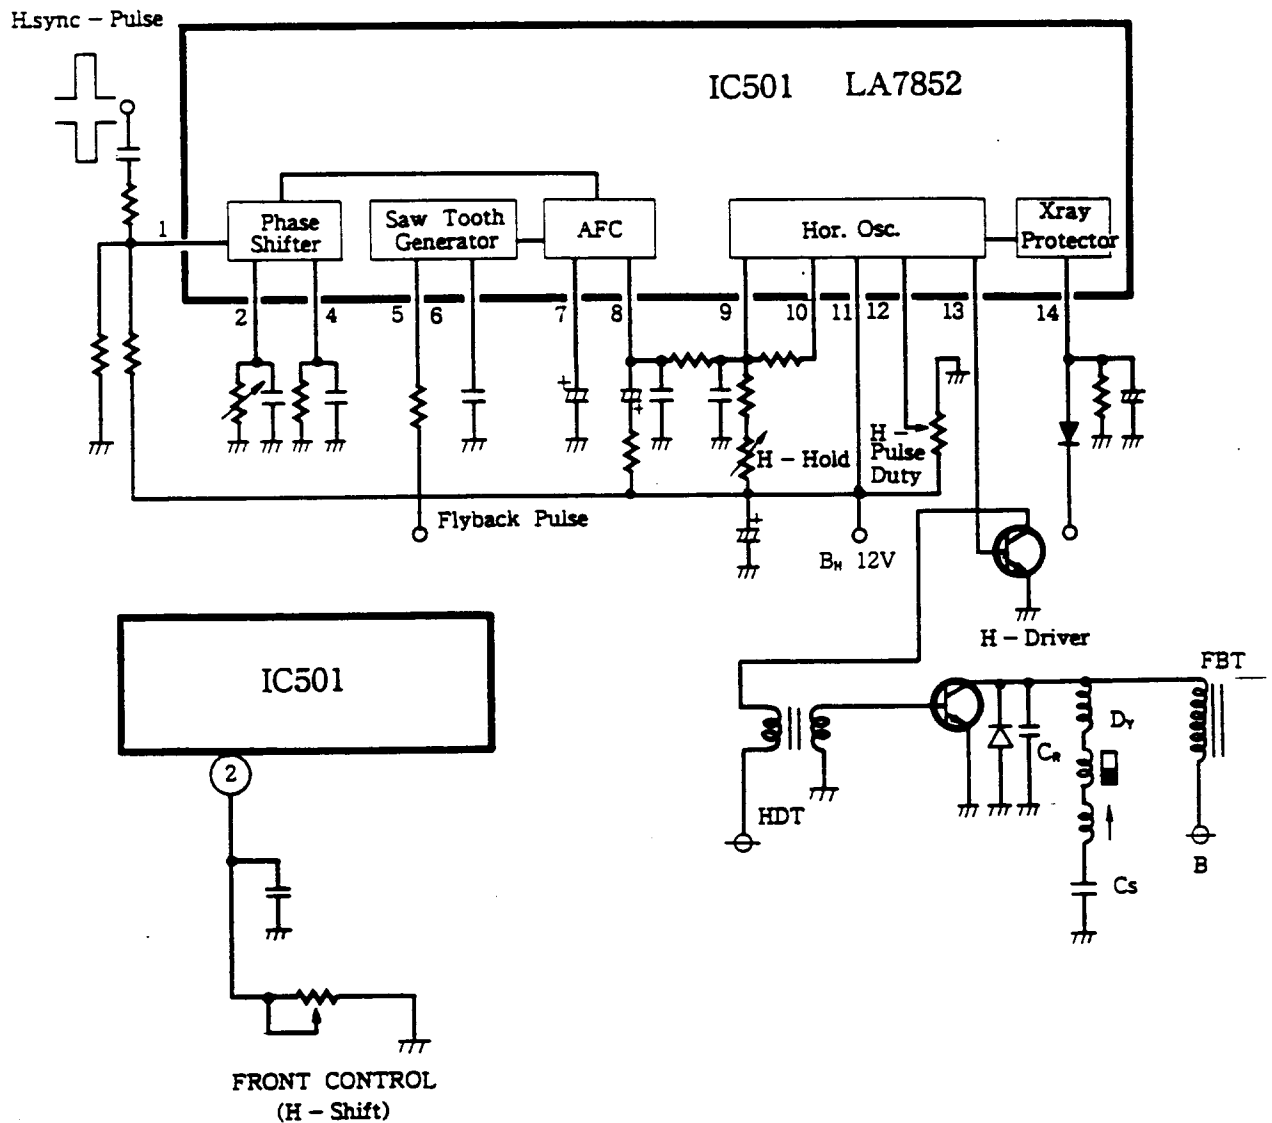

In case of the input signal is more than 35.5KHz, free running frequency is determined by D587, 586 and 585.

In case of the input signal is less than 15.7KHz, free running frequency is determined by D581.

## 2) HORIZONTAL DEFLECTION CONTROL

The horizontal deflection circuit is controlled by IC501 which has phase shifter inside of IC. The phase shift control is controlled by mono-multi and H-SHIFT control which made the more delayed pulse than sync. signal so that it can be control the raster position. The inner block of IC501 is shown as below.

### 3) H - OUT DRIVE

In generally, H - out drive is controled to constantly condition but this monitor have two scan mode (Wide or Normal) which is selectable by scan switch on rear panel.

The each condition is made by changing of the horizontal deflection current.

The mode switch is available in a horizontal scanning range of 15 to 25KHz.

If it select to "Wide" position, R51A is shorted by Q5D2 so that primary current ( $I_1$ ) of T501 increase which increase to the secondary current ( $I_2$ ).

As the result, above operation supply to the enough deflection current for wide scan.

### 4) WIDE SCAN ( $C_R$ SELECTION)

When select to the "Wide - scan" mode, CR (Resonance Capacitor) in deflection circuit increase to C5R1 which increase to the retrace time, then it reduce to operate the high voltage of anode.

However, feedback circuit from high voltage supply line is control to the B4 voltage which get the stabilized high voltage.

The result of these operation, they increase the deflection current so that raster size can be expand.

$$\text{Retrace } T_R = \pi \sqrt{L_y \cdot C_R}$$

$$\text{H. Voltage } E_a \propto B_4 \cdot (T/T_R - 1)$$

$$\text{DY. Current } I_y = B_4 \cdot T_s / L_y$$

5) LINEARITY COMPENSATION (Cs)

The Cs of linearity compensation capacitor is changed to 4 elements which compensate to the raster condition for wide frequency range.

6) HORIZONTAL WIDTH CONTROL

The horizontal raster size is controlled by VRHSZ (H - Size) on the front panel which change to the primary impedance of T502 so that it control to the deflection current.

7) HORIZONTAL POSITION CONTROL

The horizontal raster position can be control by DC bias current of deflection yoke.

The switch of S251 is use for change to the polarity of DC bias current.

The switch of S252 is use for change to the value of DC bias current.

8) HOLD DOWN

The diode of D502 in horizontal deflection circuit is connect to between ⑭pin of IC501 and 3rd winding of ⑩pin on T504.

When the flyback pulse from ⑩pin of T504 increased (equivalent value as more than 28KV of anode voltage), D502 is turn to ON so that thyristor in IC501 is stopped to horizontal oscillation which protect the X - ray radiation.

9) V - HOLD

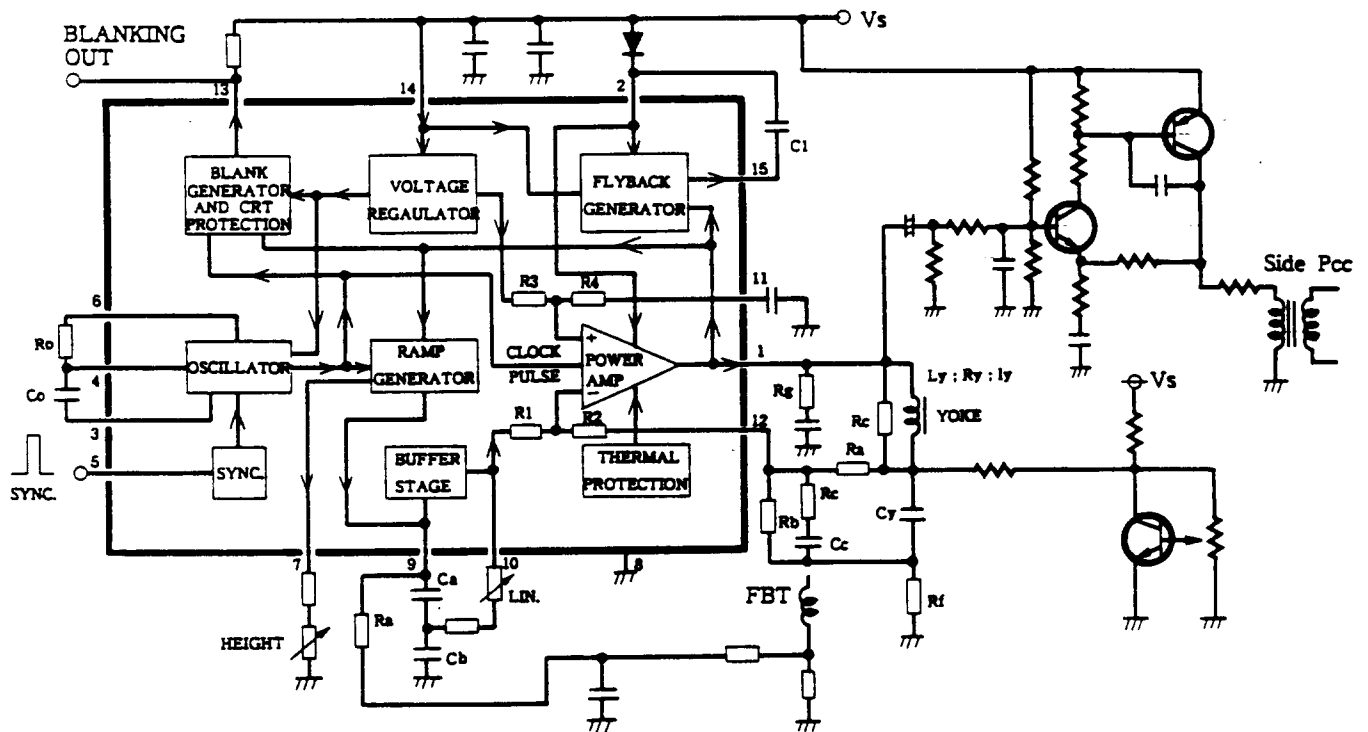

The operation of V - HOLD circuit is basically same operation as H - HOLD circuit.

The free running frequency of vertical deflection is controlled by charge or discharge period of C404.

10) V - DEFLECTION

The vertical deflection circuit is directly driven by IC401.

The block diagram of vertical deflection circuit is as follows :

## 2.3 HIGH VOLTAGE

The pulse voltage of  $V_{cp}$  on horizontal deflection circuit is step up by T504 of flyback transformer which supply to the high voltage circuit, of anode, focus and screen.

And 3rd winding of T504 produce to 80V, 180V power supply voltage.

### 1) THE RASTER REGULATION CONTROL

The flyback pulse for high voltage is supplied from horizontal deflection circuit and then the power supply line of video circuit is supplied from 3rd winding of T504.

When the beam current increase, the anode voltage is go down so that raster size change to more bigger than normal condition.

Therefore, the beam current is fed back to the B4 voltage control circuit which correct to the horizontal raster condition.

Also the beam current is fed back to the vertical height control circuit in vertical controller of IC401 which correct to the vertical raster condition.

So, these feed back circuit improve to the raster regulation.

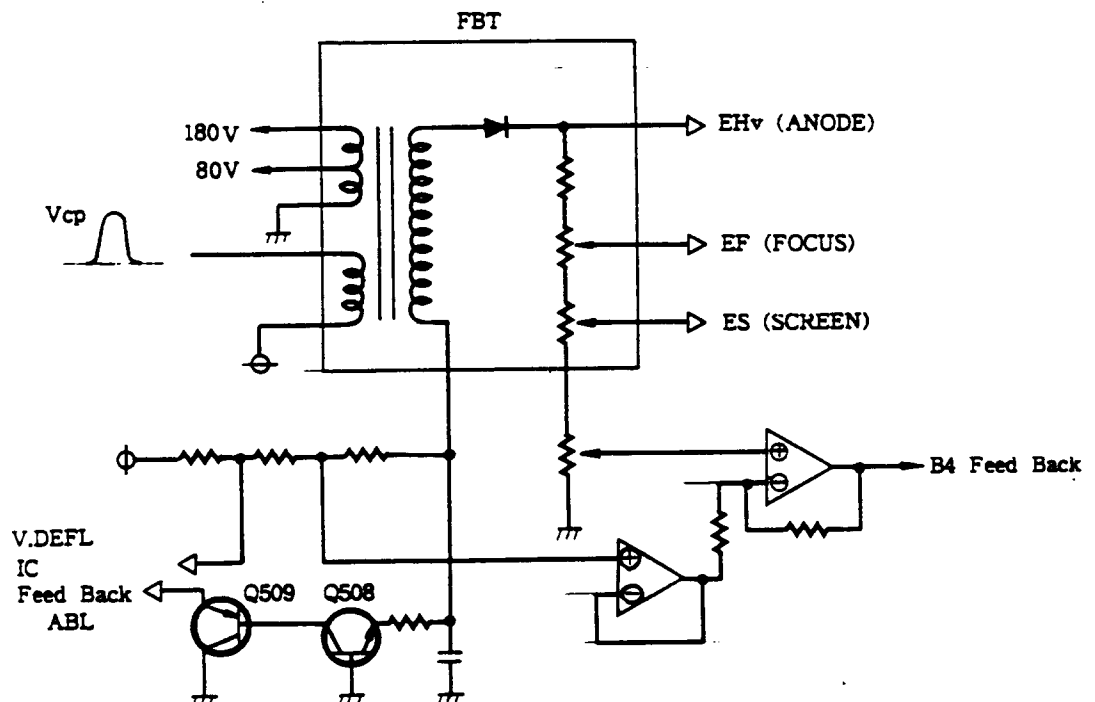

### 2) THE HIGH VOLTAGE STABILIZED CIRCUIT

The divided anode voltage by breeder resistor in T504 is fed back to the B4 voltage line which is stabilized to the anode voltage.

### 3) ABL CIRCUIT

The detection circuit of beam current is composed by Q508 and Q509.

Q509 is use for current detector and Q509 is use for driver of ABL cuicuit which control to the gain of video signal then it automatically limit the beam current.

## 2.4 VIDEO

### 1) GENERAL

(1) The monitor can be input the following signals.

- (1) - 1 Separated analog video + Separated TTL sync.
- (1) - 2 Separated analog video + Composite TTL sync.
- (1) - 3 Sync. on green
- (1) - 4 Separated TTL video + Separated TTL sync.
- (1) - 5 Separated TTL video + Composite TTL sync.

The TTL sync. signal is available to both polarity (Negative or Positive).

(2) Selection of Input signal

The selection of Analog or TTL signal is selectable by S203 which change to the operation of USER - CONT - VR (CONT, BRT).

(3) TTL INPUT

The TTL input signal is converted to digital to analog signal by IC201 which output is selectable to <sup>8 or</sup> pastel 16 or saturated 16 or 64 colors by color mode select switch.

This monitor has Text display which display White Green or Amber monochrome color.  
(Only at TTL input)

(4) ANALOG INPUT

The analog input signal or digital to analog converted TTL signal input to IC202 which control to the DC clamping level, bias and gain.

The DC clamping level is determined by clamp pulse of ⑤ pin and clamp level voltage of 16 pin on IC202.

The Gain is determined by DC voltage of ④ on IC202.

IC212 is operate to the detail gain adjustment which is controled to constantly brightness by IC209 connect at compatible P/C.

(5) BRIGHT, GAIN, USER - VR

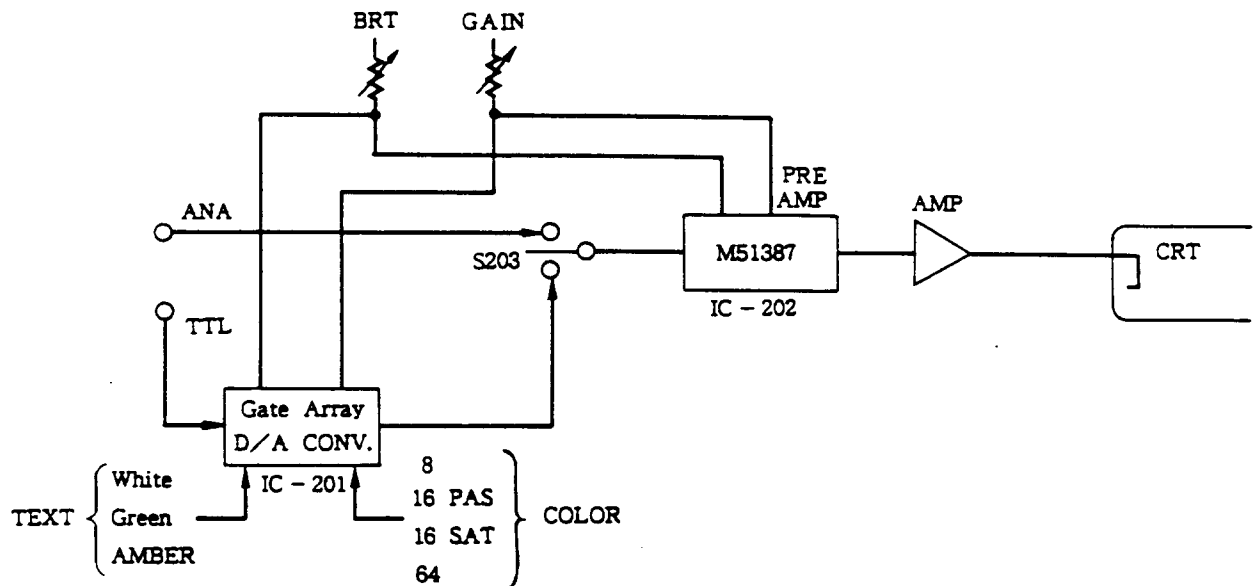

The Brightness control with click center can be control to bias level at analog input and low intensity brightness at TTL input.

### 2) VIDEO CIRCUIT

The video input signal can be input from shrinked D - SUB ⑤ pin connector which available to both of Analog or TTL signal level. (BNC is used only analog signal)

The Analog or TTL signal is selectable by S203 which input to pre - amplifier of IC202.

(1) Block Diagram of Video Circuit

(2) Pre Amplifier

- (2) - 1 The TTL input signal is applied to the gate array of IC201, it is selectable to following mode by mode select switch on the rear panel.

The decoded TTL signal is supplied from gate array of IC201 by open collector which connect to the brightness and contrast controls then it convert to digital to analog voltage of 0 to 1.0V level so that it is separated from the brightness and contrast circuit.

- (2) - 2 The analog singal is directly applied to the pre - amplifier of IC202 via S203 which signal is controled to bias and gain by brightness and contrast controls then it amplified by IC202.

And amplified signal controled by correct current for each frequency range which get the constanly brightness.

(3) Main Amplifier

The output of pre - amplifier is applied to the cascade amplifier of Q6□1.6□2 which amplified by SEPP buffer of Q6□3.6□4 and they produce to cathode of CRT with 40Vp - p level.

# <SIGNAL SELECTOR BLOCK>

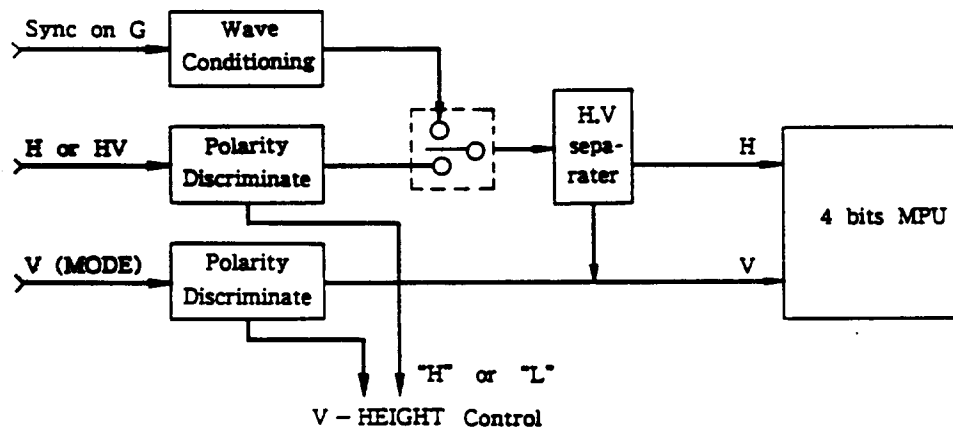

## 3) SYNC. SIGNAL

### (1) Available Sync. Signal

- Separate TTL with Positive or Negative Polarity.
- Composite TTL with Positive or Negative Polarity.
- Sync. on Green with 0.3V Analog Level.

### (2) Sync. Polarity Discriminate Circuit

Above sync. signals are converted to the DC level signal which input to the MPU (Micro Processor Unit) and they use for the control signal of V - Height at preset mode.

#### 4) SYNC. ON GREEN DETECT CIRCUIT

Normally, in case of horizontal separate sync. with TTL level which sync. pulse protect to the sync. on green signal by exclusive or gate after mono stable multi vibrator show as below. However, in case of sync. on green signal which pulse through the above exclusive or gate, so it output to the sync. on green signal.

#### 5) SYNC. SEPARATE CIRCUIT

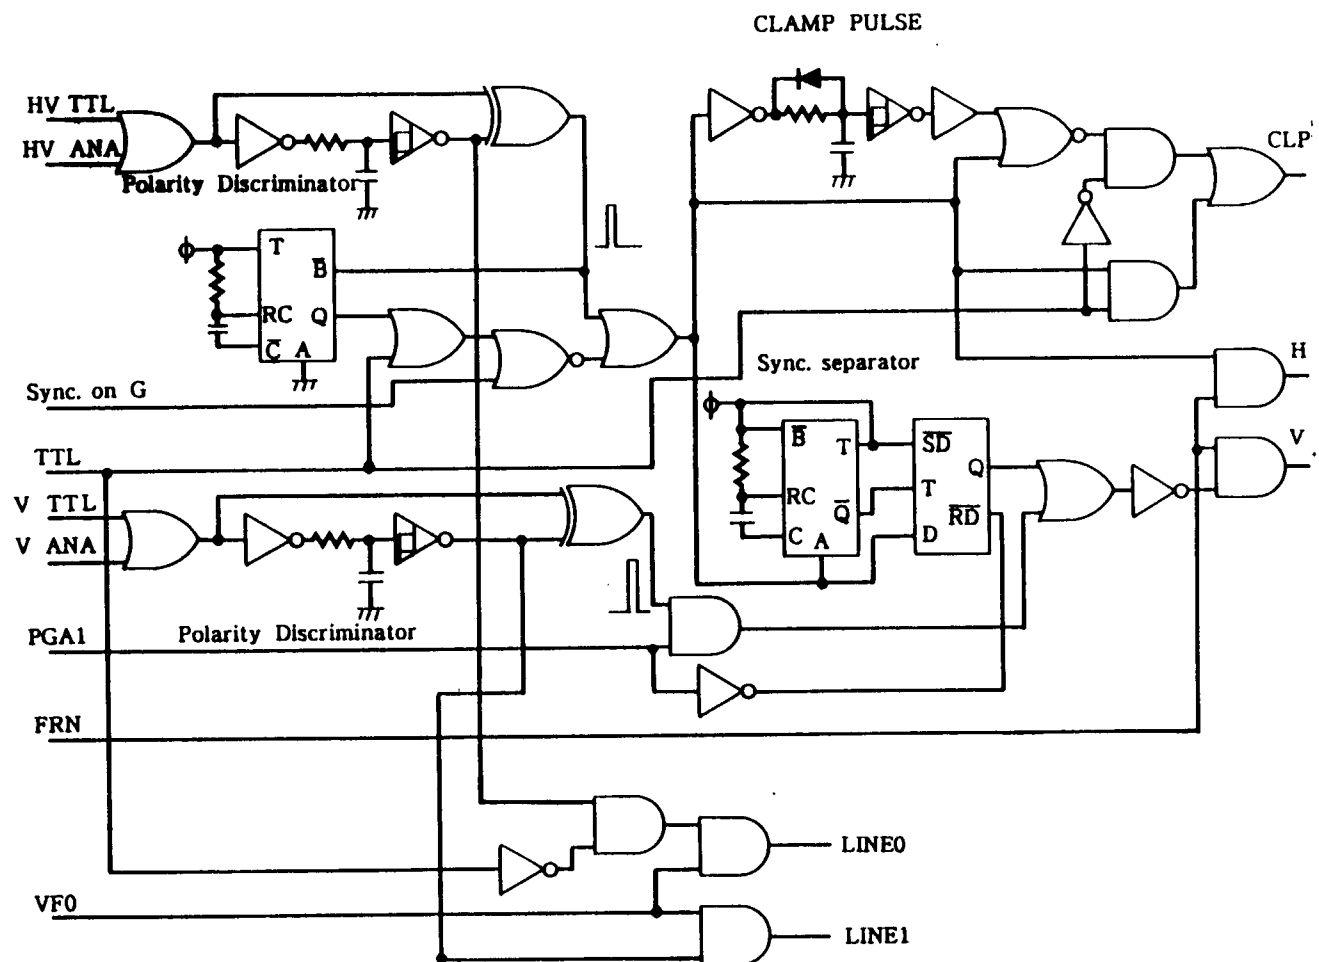

The sync. separate from composite sync. signal is separated by digital circuit of shown as below which get the high resolution and stabilized operation.

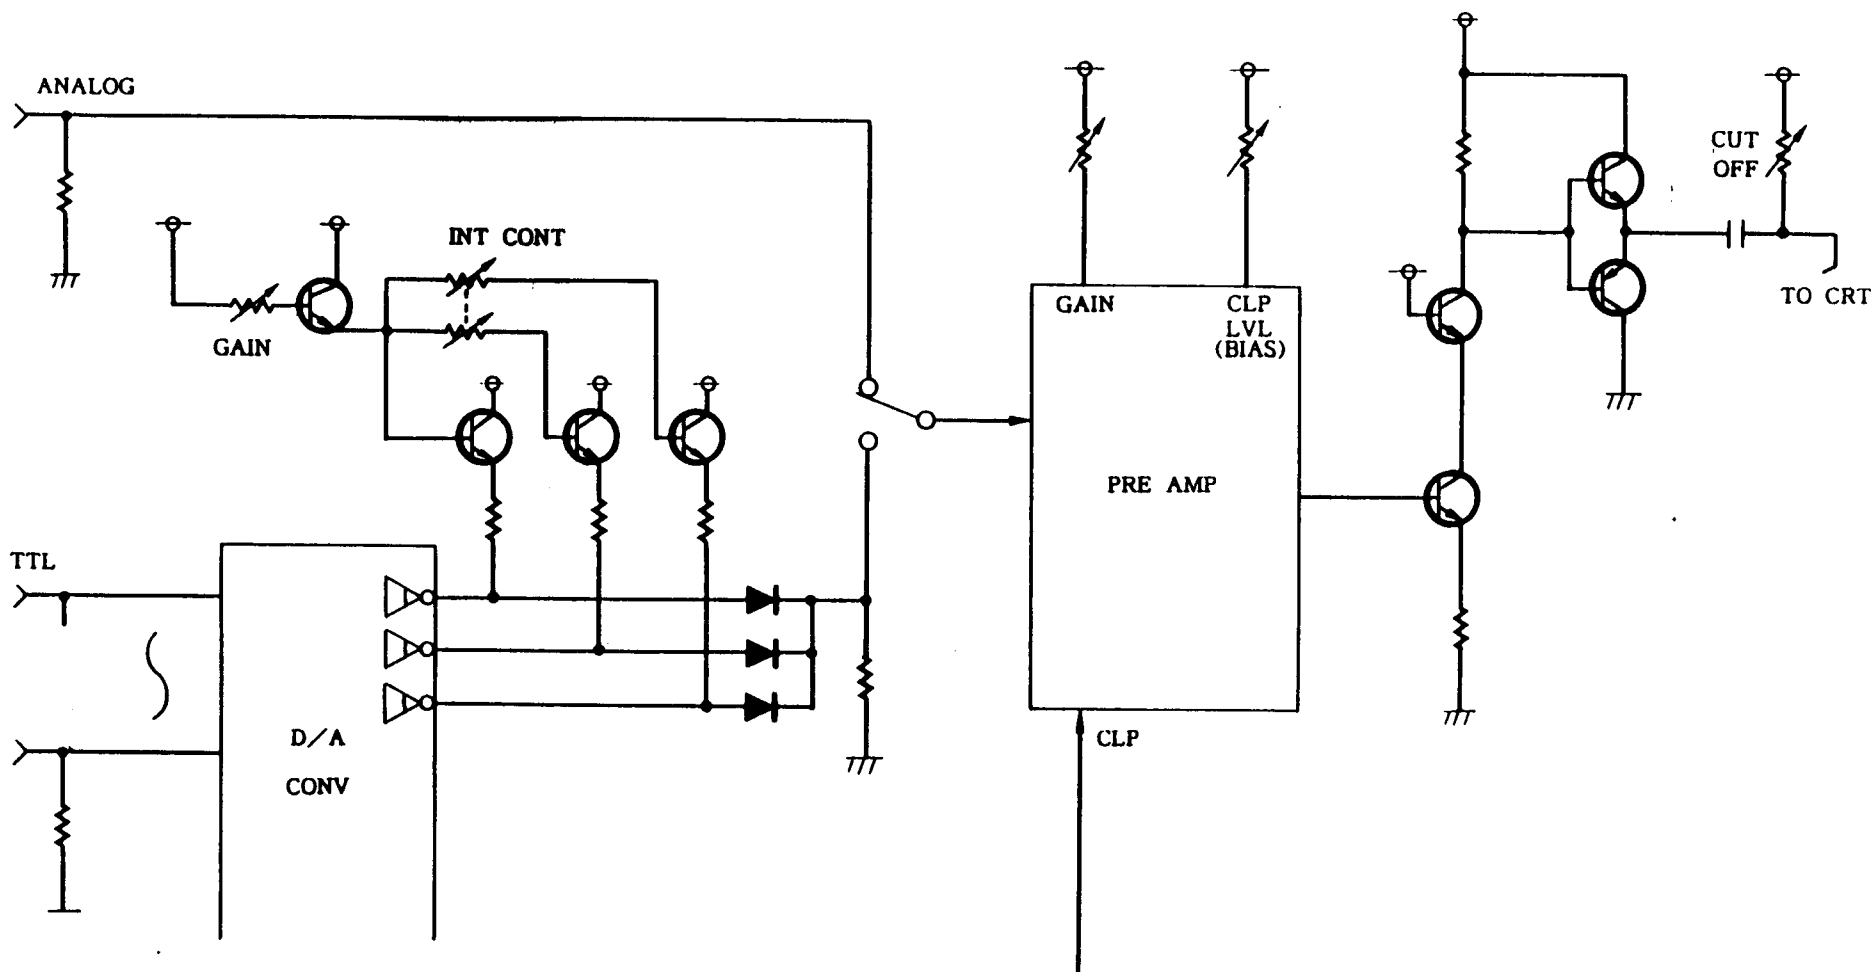

#### 6) BRIGHTNESS CONTROL

The BRIGHT and CONTRAST (GAIN) controls are operate to as follows :

		ANALOG	TTL
CONTRAST (GAIN)	☐	GAIN CONTROL	TOTAL GAIN
BRIGHT	☀	BIAS CONTROL	LOW INT. GAIN

〈SIGNAL CONDITIONING CIRCUIT - 1〉

## 2.5 MPU

### 1) MODE SELECT CIRCUIT

The signal mode is determined by conditions of frequency, signal polarity, signal type and position of mode selection switch.

The mode selection is controled by 4bits MPU of IC209 which get the optimum raster condition in the wide frequency range.

When the mode select switch set up the "Preset" position, the monitor is fully compatible to IBM P/C.

The block diagram of MPU is shown as Fig. 2 - 1.

Each condition of CGA, MDA, PGC or VGA is discriminated by polarity and type of sync. signal which condition is controled by IC209 and it automatically control to the raster size, position and brightness at "Preset" position.

In case of select to "Preset" mode with input to the IBM P/C signal, it get the optimum raster condition without any adjustments.

The horizontal frequency is encoded to 2bits signal which use for the selection signal of linearity capacitor (Cs).

### 2) FREQUENCY DISCRIMINATE CIRCUIT

The construction of hard ware is shown as Fig. 2 - 2.

The vertical sync. signal is interrupt "1" after divided to  $1/4$  of horizontal frequency.

The internal clock generator of MPU generate to the timer interrupt of 0.5ms sync.

The vertical sync. frequency (FV) is counted by formula of  $4 - 1$  which count to the number (Vc) of timer interrupt during 1 period in vertical interrupt.

$$F_v = 1 / (0.5 \times 10^{-3} \times V_c) = 2000 / V_c \text{ [Hz]} \quad \dots\dots 4 - 1$$

Vc in formula is counted by two words soft ware of RAM.

The horizontal frequency (FH) is counted by formula of  $4 - 2$  which count to the number of horizontal interrupt (Hc) during the delayed 5ms after finished vertical interrupt to next 5ms.

$$F_H = 4H_c / (5 \times 10^{-3}) = 4H_c / 5 \text{ [KHz]} \quad \dots\dots\dots 4 - 2$$

The counted frequency is divided to the 4 ranges shown as table 2.

The divided horizontal frequency gave the enough interrupt processing time.

The min. period of interrupt is same as horizontal interrupt which becomes min. at 35.5KHz of horizontal frequency.

The delay time of 5msec after finishing the vertical interrupt is prevent to miss - operation for a kind of equivalent pulse in composite sync. signal. (Fig. 2 - 3)

### 3) SYNC. TYPE DISCRIMINATE CIRCUIT

The MPU has sync. type discriminate function which shown as Fig. 2 - 4.

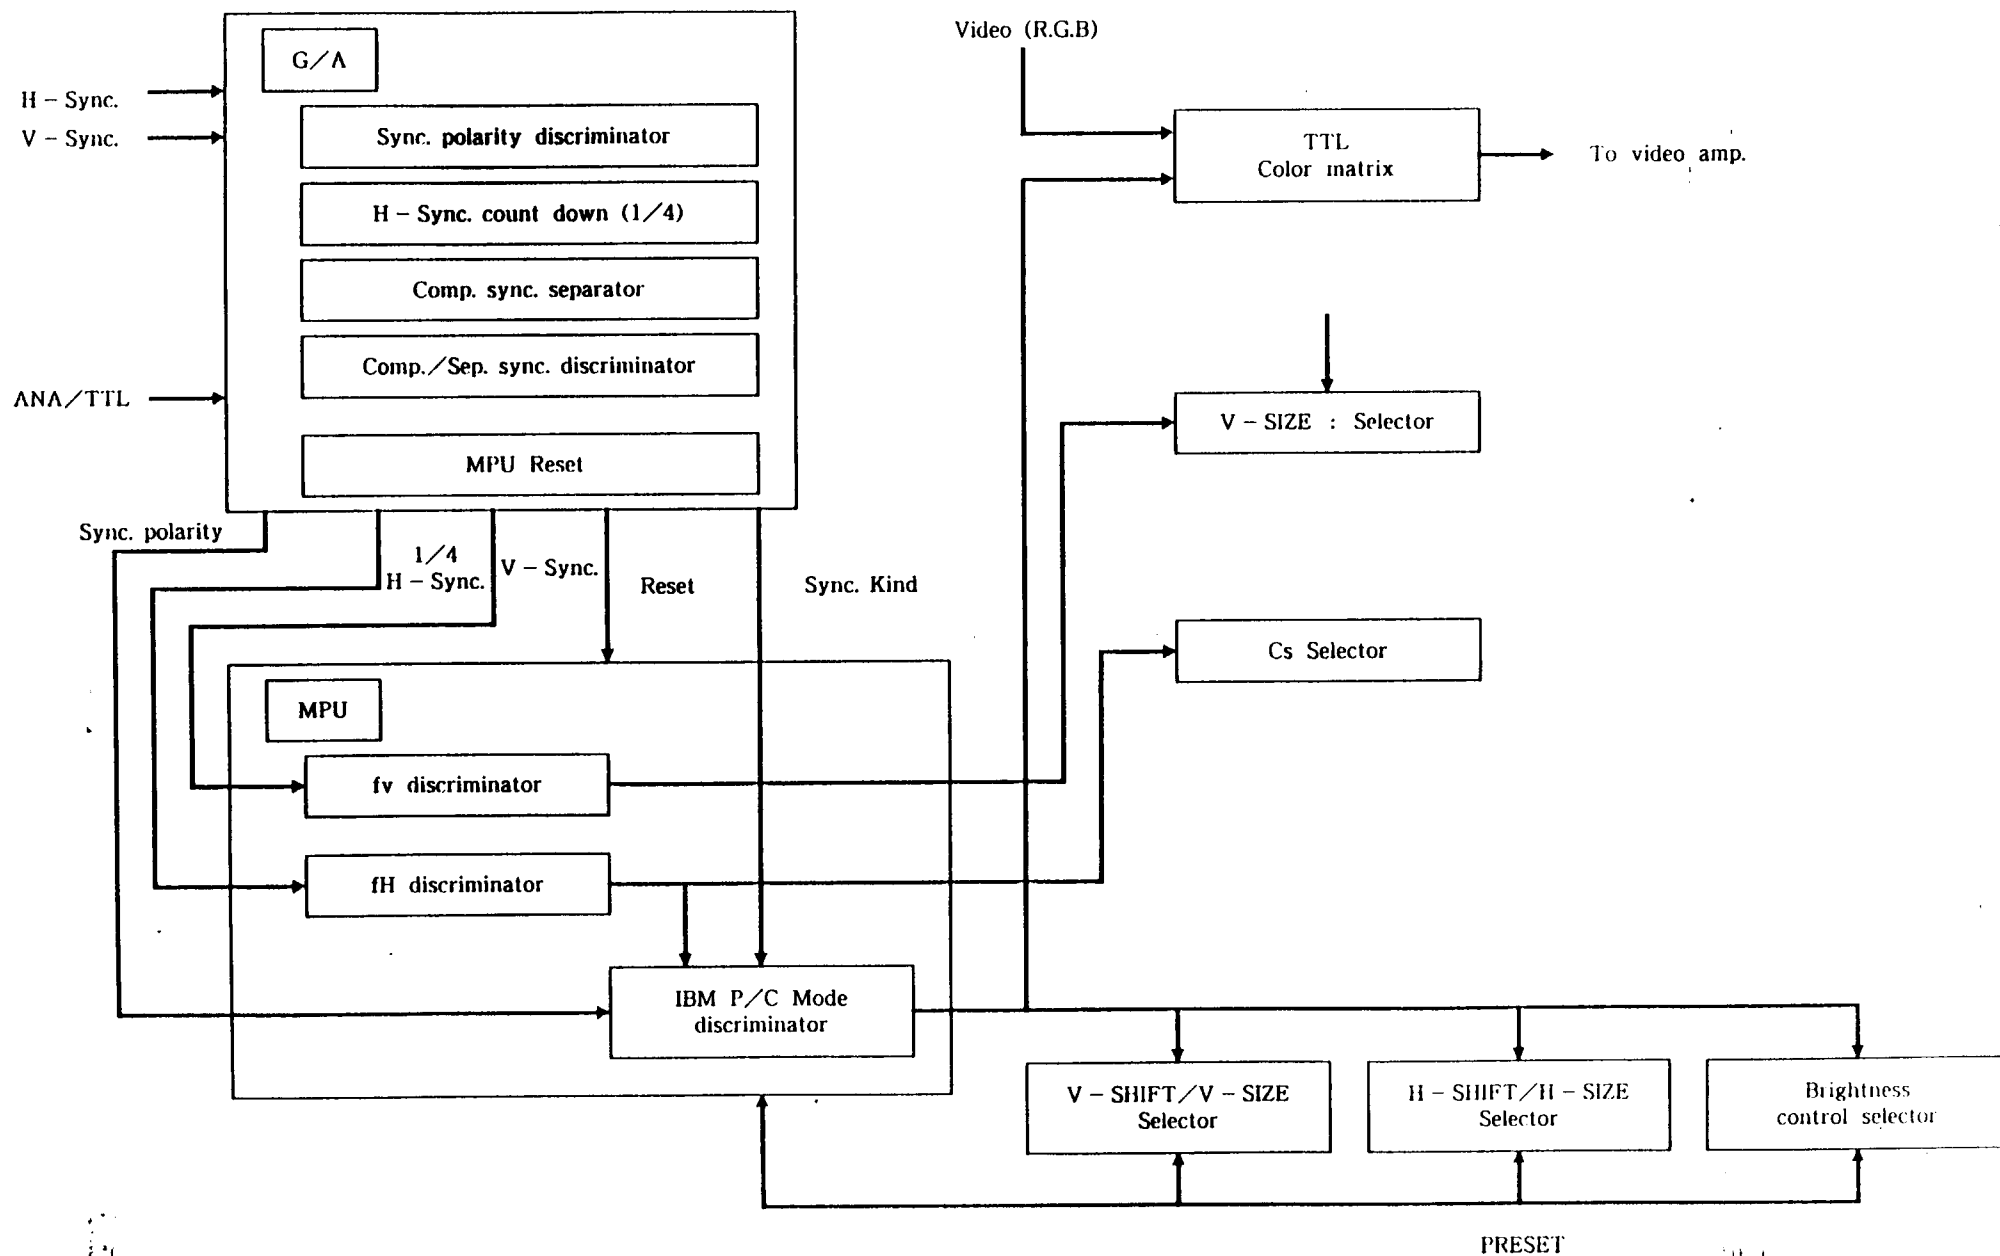

### 4) THE FREQUENCY DETECTING CIRCUIT

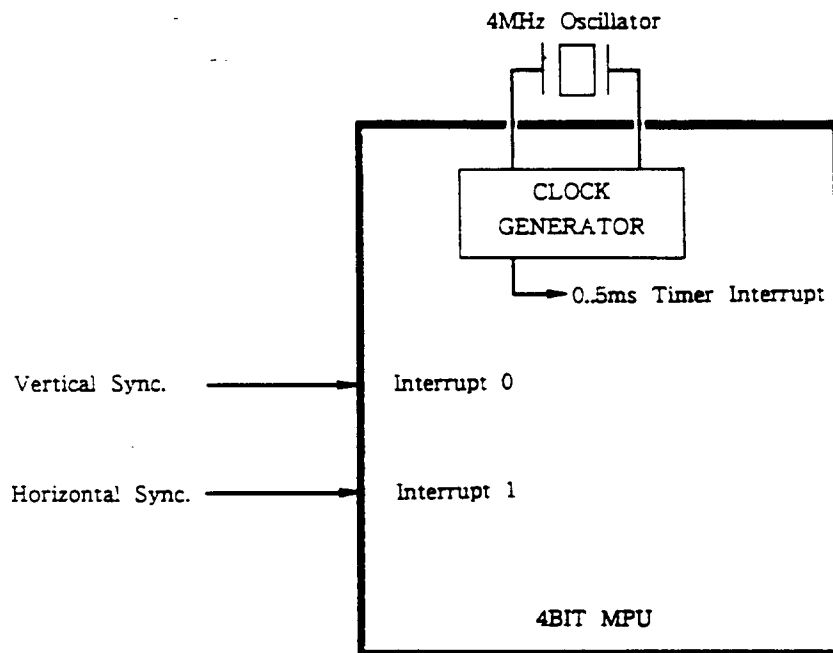

The sync. frequency is detected by MPU which detect to more than 2KHz of horizontal frequency and more than 4Hz of vertical frequency.

When the signal board generate to the unstable signal, the MPU output to the blanking pulse which prevent to the abnormal raster.

The flow chart is shown as Fig. 2 - 5.

〈Fig. 2 - 1 BLOCK DIAGRAM OF SIGNAL PROCESSOR〉

< Fig. 2 - 2 Frequency Discriminate Circuit >

< Fig. 2 - 3 Timing Chart of Frequency Discriminate >

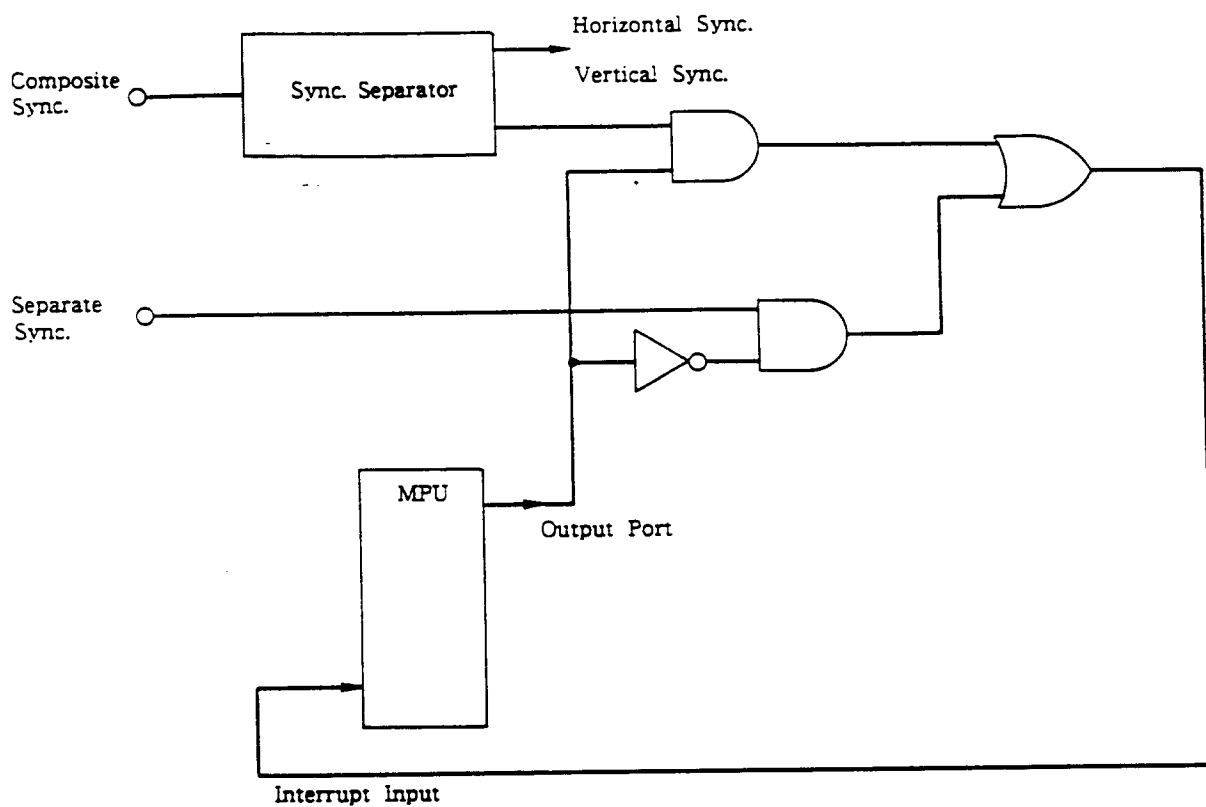

Range	Span	Resolution
V50	50 ~ 55Hz	1.2Hz at 50Hz
V60	55 ~ 65Hz	1.8Hz at 60Hz
V70	65 ~ 80Hz	2.5Hz at 70Hz
V80	80 ~ 87Hz	4.0Hz at 85Hz

〈Time Chart of Reset Circuit〉

# 5) MODE CONTROL

The monitor has a input mode control function which is to select a video signal - either TTL or ANALOG, and at preset mode control position which is to be fully compatible with the IBM graphics adapter.

## PRECAUTION FOR INSTALLATION :

1. Color CRT is sensitive to the environmental magnetic field in nature.  
Careful degaussing by hand degausser over the whole CRT may be required in case the color monitor module installed in or near the metal rack/panel.
2. Avoid to install the near of electromagnetic machine (motor, transformer etc.) or high tension cable.

### 3.2 ADJUSTMENT PROCEDURE FOR FA34 SERIES

[illegible]

ITEM	SIGNAL & NO.	CONTROL	ADJUSTMENT
9. FOCUS	CHARACTOR ⑧	FOCUS	ADJUST FOCUS CONTROL ON FBT TO GET OPTIMUM FOCUS.
10. SIDE P.C.C.	WHITE ⑧	VRPCC	ADJUST VRPCC TO GET STRAIGHTLY RASTER.
11. HORIZONTAL WIDTH	WHITE ⑧	VR5WN	1) SET UP BRIGHT CONTROL TO MAX. POSITION. 2) ADJUST HORIZONTAL WIDTH TO ABOUT 240mm BY VR5WN.
12. H - PHASE H - POSITION	WHITE ⑨	GAIN  VR5PN  S251.252	1) ADJUST BRIGHT AND GAIN CONTROLS TO GET DIMLY BACK RASTER. 2) ADJUST VIDEO PHASE TO SETTLED ON CENTER OF BACK RASTER BY VR5PN. 3) ADJUST HORIZONTAL POSITION TO SETTLED ON CENTER OF BEZEL BY S251 AND S252.
13. HORIZONTAL WIDTH AND POSITION	WHITE ⑩	VR5WP  VR5PP	1) ADJUST HORIZONTAL WIDTH TO ABOUT 240mm BY VR5WP. 2) ADJUST HORIZONTAL POSITION TO SETTLED ON CENTER OF BEZEL BY VR5PP.
14. HORIZONTAL WIDTH AND POSITION	WHITE ⑪	VR5WC  VR5PC	1) ADJUST HORIZONTAL WIDTH TO ABOUT 240mm BY VR5WC. 2) ADJUST HORIZONTAL POSITION TO SETTLED ON CENTER OF BEZEL BY VR5PC.
15. HORIZONTAL WIDTH AND POSITION	WHITE ⑫	VR5WE  VR5PE	1) SET UP INPUT SIGNAL SWITCH TO TTL POSITION. 2) ADJUST HORIZONTAL WIDTH TO ABOUT 240mm BY VR5WE. 3) ADJUST HORIZONTAL POSITION TO SETTLED ON CENTER OF BEZEL BY VR5PE.
16. VERTICAL LINEARITY	CROSS HATCH ⑬	VR404	ADJUST VR404 TO GET EQUAL SPACING BETWEEN TOP AND BOTTOM OF CROSS HATCH
17. VERTICAL HEIGHT AND POSITION	WHITE ⑭	VR4S7  VR4P1	1) ADJUST VERTICAL HEIGHT TO ABOUT 180mm BY VR4S7. 2) ADJUST VERTICAL POSITION TO SETTLED ON CENTER OF BEZEL BY VR4P1.

ITEM	SIGNAL & NO.	CONTROL	ADJUSTMENT
18. BRIGHTNESS	WINDOW ⑤	VR201	1) SET UP INPUT SIGNAL SWITCH TO ANALOG POSITION.  2) ADJUST LUMINANCE TO $115 (BL9 = 85) \pm 3\text{nits}$ BY VR201 WHICH MEASURED BY LUMINANCE METER.  3) SET UP INPUT SIGNAL SWITCH TO TTL POSITION.
	WINDOW ④	VR202	4) ADJUST LUMINANCE TO $125 (BL9 = 80) \pm 3\text{nits}$ BY VR202.
19. X - RAY PROTECTOR	WHITE ④		1) APPLY TO DC $50 \pm 1\text{V}$ BETWEEN TPX AND CHASSIS GND. THEN CHECK TO OPERATE THE X - RAY PROTECTION CIRCUIT.  2) TURN OFF THE MONITOR.  3) RECHECK THE NORMAL RASTER, AFTER 5sec. FROM TURN OFF.

## AC VOLTAGE SELECTION PROCEDURE ON FA3435

- (1) This monitor is available to select the both voltage of 120 volts AC and 220 / 240 volts AC by tap selection.
- (2) There are two tap position on the POWER PCB which is selectable by connector of marked **E**.
- (3) The tap position of marked **S4** is available to input 100 / 120 volts AC power supply voltage.
- (4) The tap position of marked **S3** is available to input 220 / 240 volts AC power supply voltage.

### 3.4 ADJUSTMENT PROCEDURE FOR HA39 SERIES

ITEM	SIGNAL & NO.	CONTROL	ADJUSTMENT
1. HORIZONTAL & VERTICAL SYNC.  1) HORIZONTAL  2) VERTICAL	WHITE ①	VR582 VR401	1) SET UP S201 TO MAKE THE FREE RUNNING CONDITION.  2) ADJUST THE HORIZONTAL FREQUENCY TO $25.1 \pm 0.2\text{KHz}$ BY VR582.  3) ADJUST THE VERTICAL FREQUENCY TO $53.0 \pm 1.0\text{Hz}$ BY VR401.  4) BACK TO THE NORMAL (CENTER) POSITION OF S201 AFTER ABOVE ADJUSTMENT. * MEASURED BY FREQ. COUNTER
2. B4 VOLTAGE	NO VIDEO ⑫	VR5HV	1) H - SIZE OF VR  TURN TO MAX. POSITION.  2) CONNECT THE DC VOLTMETER BETWEEN TPB4 AND GND.  3) ADJUST VR5HV TO $100 \pm 1.0\text{V}$ READING ON METER.
3. CUT - OFF	NO VIDEO ⑬	SCREEN VR601 VR6R1 VR6G1 VR6B1	1) ADJUST THE SCREEN VOLTAGE FOR A $660 \pm 5\text{V}$ BETWEEN TPSC AND CHASSIS GND BY SCREEN CONTROL.  2) SET UP S201 TO MAKE THE HORIZONTAL LINE.  3) ADJUST VR601 TO GET THE DIMLY LINE.  4) ADJUST VR6R1, 6G1, 6B1 TO GET THE WHITE HORIZONTAL LINE.  5) BACK TO THE NORMAL POSITION OF S201 AFTER ABOVE ADJUSTMENT.
4. FOCUS	CHARACTOR ⑭	FOCUS	ADJUST FOCUS CONTROL ON FBT TO GET THE OPTIMUM FOCUS CONDITION.
5. P.C.C.	CROSS-HATCH ⑮	VRPCC	ADJUST VRPCC TO GET THE STRAIGHTLY RASTER.
6. WHITE BALANCE AND BRIGHTNESS	WINDOW ⑯	VR201 VR2R1 VR2B1          VR202	1) ADJUST VR2R1, 2B1 TO GET THE WHITE RASTER FOR A $X = 0.283 \pm 0.015,$ $Y = 0.297 \pm 0.015$ READING ON THE COLOR ANALYZER ON THE CENTER OF SCREEN AT ABOUT 110nits. (BL9 = ABOUT 75nits)  2) TURN BRIGHTNESS CONTROL TO MAX. POSITION.  3) SET UP S203 TO TTL POSITION.  4) SET UP "MODE SW" TO NORMAL POSITION.  5) .ADJUST VR202 TO ABOUT 110nits (BL9 = 75nits) READING ON LUMINANCE METER.

ITEM	SIGNAL & NO.	CONTROL	ADJUSTMENT
7. RASTER SIZE AND POSITION	WHITE VGA 400lines ③		1) SET UP "MODE SW" TO PRESET POSITION.
1) HORIZONTAL WIDTH		VR5WN	2) TURN BRIGHTNESS CONTROL TO CLICK STOP POSITION.
			3) SET UP S203 TO ANALOG POSITION.
2) HORIZONTAL POSITION	VGA 480lines ⑦		4) ADJUST HORIZONTAL WIDTH TO ABOUT 350mm BY VR5WN.
			5) IF TURN UP THE RASTER, ADJUST VR5PN.
3) VERTICAL LINEARITY	CROSS - HATCH ⑦	VR404	6) ADJSUT HORIZONTAL RASTER POSITION TO CENTER POSITION OF BEZEL BY VR4PN.
			7) ADJUST VERTICAL LINEARITY TO GET THE SAME SPACING BETWEEN TOP AND BOTTOM OF CROSS HATCH BY VR404.
			
4) VERTICAL HEIGHT		VR4S7	8) ADJUST VERTICAL HEIGHT TO ABOUT 265mm BY VR4S7.
5) VIDEO PHASE	WHITE ⑪ VGA 400lines ③	BRIGHT	9) ADJUST BRIGHTNESS CONTROL TO GET THE DIMLY BACK RASTER.
		VR5PN	10) ADJUST RASTER CENTERING TO SETTLED ON THE CENTER OF BACK RASTER BY VR5PN.
6) RASTER POSITION	WHITE VGA 400lines ③	S251 S252	11) ADJUST RASTER CENTERING TO SETTLED ON THE CENTER OF BEZEL BY S251 AND 252.
	WHITE ⑪	VR5WP	12) ADJUST HORIZONTAL WIDTH TO ABOUT 350mm BY VR5WP.
		VR5PP	13) ADJUST RASTER CENTERING TO SETTLED ON THE CENTER OF BEZEL BY VR5PP.
	WHITE ⑫	S203	14) SET UP S203 TO TTL POSITION.
		GAIN	15) ADJUST GAIN CONTROL TO CLICK POSITION.
		VR5WC	16) TURN VR5WC TO FULLY COUNTER CLOCKWISE.
		VR5PC	17) ADJUST RASTER CENTERING TO SETTLED ON THE CENTER OF BEZEL BY VR5PC.
	WHITE ⑬	VR5WE	18) TURN VR5WE TO FULLY COUNTER CLOCKWISE.

ITEM	SIGNAL & NO.	CONTROL	ADJUSTMENT
		VR5PE	19) ADJUST RASTER CENTERING TO SETTLED ON THE CENTER OF BEZEL BY VR5PE.
8. BRIGHTNESS	WINDOW ⑧	BRIGHT  GAIN  VR201    VR202	1) TURN BRIGHTNESS CONTROL TO CLICK POSITION. 2) TURN GAIN CONTROL TO MAX. POSITION. 3) ADJUST VR201 TO GET ABOUT 110nits (BL9 = 75nits) BRIGHTNESS BY LUMINANCE METER ON THE CENTER OF SCREEN. 4) SET UP S203 TO TTL POSITION. 5) SET UP MODE SWITCH TO NORMAL POSITION. 6) TURN GAIN AND BRIGHTNESS CONTROL TO MAX. POSITION. 7) ADJUST VR202 TO GET ABOUT 110nits (BL9 = 75nits) BRIGHTNESS BY LUMINANCE METER ON THE CENTER OF SCREEN.
9. X - RAY PROTECTOR	WHITE ⑧  VGA 400lines		1) APPLY TO DC VOLTAGE OF 41V BETWEEN TEST POINT TP = X AND CHASSIS GND. 2) TURN OFF THE MONITOR AFTER STOPPING THE OPERATION. 3) RECHECK THE NORMAL RASTER. AFTER 5sec. FROM TURN OFF.

### 3.5 TIMING CHART

#### (1) HORIZONTAL (1H)
