Technical Data

General

Mains voltage	: 195 - 264V
Mains frequency	: 47 - 63 Hz
Power consumption	: 85 W (nominal) 120 W (max)
Operating temperature	: 0°C to 40°C
Weight	: 18.8 kg
Width x Depth x Height	: 422 x 440 x 425 mm

Picture tube

Size	: 17 inch
Light transmission	: 53.5 % (dark glass)
Deflection angle	: 90 Degree
EHT voltage	: 25 kVolt
Pitch	: 0.31 mm

Video

Dot rate	: 75 MHz
Video signal	: 0.7 Vpp/75Ω

Sync. signal

Vertical frequency	: 50 - 100 Hz
Horizontal frequency	: 30 to 58 kHz
- separated H/V sync.	: TTL-level
- composite H/V sync.	: TTL-level
- composite sync.	: on Green
- sync. polarity	: positive or negative

Audio

- Input signal	: 150 mV_{rms}/22kΩ
- Output	: 1 W

* Specifications are subject to change without notice !

RESOLUTION MODES AND SYNC. POLARITIES

Modes	Horizontal frequencies	Vertical frequencies	H. sync. polarity	V. sync. polarity	Resolution Dot * lines
VGA	31,5 kHz	70 Hz	Positive (+)	Negative (-)	640 * 350
VGA	31,5 kHz	70 Hz	Negative (-)	Positive (+)	640 * 400
VGA	31,5 kHz	60 Hz	Negative (-)	Negative (-)	640 * 480
S-VGA	37.8 kHz	72 Hz	Positive (+)	Positive (+)	640 * 480
MAC-II	35.0 kHz	67 Hz	Compositie Sync on green (-)	Compositie Sync on green (-)	640 * 480
S-VGA	35.2 kHz	56 Hz	Negative (-) Positive (+)	Negative (-) Positive (+)	800 * 600
S-VGA	37.8 kHz	60 Hz	Positive (+)	Positive (+)	800 * 600
S-VGA	48.1 kHz	72 Hz	Positive (+)	Positive (+)	800 * 600
APPLE	49.8 kHz	75 Hz	Negative (-) Positive (+)	Negative (-) Positive (+)	832 * 624
8514A	35.5 kHz	87 Hz	Positive (+)	Positive (+)	1024 * 768 Interlaced
	48.4 kHz	60 Hz	Negative (-)	Negative (-)	1024 * 768
	56.5 kHz	70 Hz	Negative (-) Positive (+)	Negative (-) Positive (+)	1024 * 768

INPUT- OUTPUT SIGNALS

15 pins D-Shell connector **D-Shell adapter (3 rows to 2)**

Pin	Assignment	Sensitivity	Terminal impedance	Assignment	Sensitivity	Terminal impedance
1	Red Video input	RGB-analog	75Ω	Red ground		
2	Green Video input/ sync. on green	RGB-analog	75Ω	Red Video input/	RGB-analog	75Ω
3	Blue Video input	RGB-analog	75Ω	Composite sync.		2.2 Ωk
4	Ident output (connected to 10)			Sync. ground		
5	Self test input (ground)			Green Video input	RGB-analog	75Ω
6	Red Video ground			Green ground		
7	Green Video ground			Sense		
8	Blue Video ground			Not connected		
9	Not connected (no pin)			Blue Video input	RGB-analog	75Ω
10	Logic ground			Sense 2		
11	Ident output (connected to 10)			Comp-sync + V-sync ground		
12	Not connected			V-sync		
13	Horizontal sync. (or Hor. + Vert. sync)	TTL Level L=0-0.8V H=2.4 -5V	2.2 Ωk pull down	Blue Video ground		2.2kΩ pull down
14	Vertical sync.	TTL Level L=0-0.8V H=2.4 -5V	2.2 Ωk pull down	H-sync ground		2.2kΩ pull down
15	Not connected (no pin)			H-sync		

Warnings and Notes

Warnings

1. Safety regulations require that the unit should be returned in its original conditions and that components identical to the original components are used. The safety components are indicated by the symbol ⚠.

2. In order to prevent damage to **ICs** and transistors, all high-voltage flash-overs must be avoided. In order to prevent damage to the picture tube, the method shown in Fig. 3.1 should be used to discharge the picture tube. Use a high-voltage probe and a multimeter (position DC-V). Discharge until the meter reading is **0 V** (after approx. 30s).

3. **ESD**
   All ICs and many other semiconductors are sensitive to electrostatic discharges (ESD). Careless handling during repair can drastically shorten the life. Make sure that during repair you are connected by a pulse band with resistance to the same potential as the earth of the unit. Keep components and tools also at this same potential.

4. When repairing a unit, always connect it to the mains voltage via an isolating transformer.

5. Be careful when taking measurements in the high-voltage section and on the picture tube panel.

6. It is recommended that safety goggles are worn when replacing the picture tube.

7. When making settings, use plastic rather than metal tools.
   This will prevent any short-circuit and the danger of a circuit becomes unstable.

8. Never replace modules or other components while the unit is switched on.

9. Together with the deflection unit the picture tube is used as an integrated unit. Adjustment of this unit during repair is therefor not recommended.

10. After repair the wiring should be fastened once more in the cable clamps for this purpose.

Notes

1. The direct voltages and oscillograms are average voltages. They have been measured by using the Service testsoftware and under the following conditions:
   - Mode: 1024 * 768 (56.5kHz/70Hz)
   - Signal pattern: grey scale
   - Adjust brightness and contrast control for the mechanical mid-position (click position)

2. The picture tube panel has printed spark gaps. Each spark gap is connected between an electrode of the picture tube and the Aquadag coating.

3. The semiconductors indicated in the circuit diagram(s) and in the parts lists are completely interchangeable per position with the semiconductors in the unit, irrespective of the type indication on these semiconductors.

3. Ear phone panel (1108)
4. Control panel (1110)

General

To be able to perform measurements and repairs on the "circuit boards", these unit should placed in the service position first:

Video panel

- Remove the rear cover (4 screws), see Fig. 4.2.
- Remove the metal shielding by desolder 8 lags.

Main panel and control panel

- Remove the rear cover (4 screws).
- Turn the set 90 degrees counter-clockwise.
- Remove the pedestal with the metal shielding (4 screws).
- Fig. 4.3 shows the service position.

Electrical instructions

General:

When carry-out the electrical settings in many cases a video signal must be applied to the monitor.
A computer with an "ATI VGA 1024 V6-1.04 / PH BETA 4" interface card (1024*768) is used as the video signal source. The signal patterns are selected from the service test software package.

Installation instructions for the ATI interface card:

- Place the monitor (if possible) in east-west direction.
- Place the ATI interface card in the computer.
- Select the "Vsetup" file from the "utility disk" belonging to the card.
- Select "8 bits" or "16 bits" ROM operation depends on the computer type.
- Select "analog monitor"
- Select "Magnavox CM5000" as the monitor type.
- Re-boot your computer again.
- Put the floppy disk with the "service test software" package in the computer and select the test pattern indicated for the following settings.

1. B+ supply voltage (3134)

- Apply a video signal in the 640*480 with 31.5kHz / 60Hz mode.
- Select the "cross-hatch" pattern.
- Set the brightness front control 3577 and the contrast front control 3458 to the minimum position.
- Pre-set trimming potentiometer 3134 and 3618 in mid position.
- Connect a DC voltmeter between the "+" pole of capacitor 2152 (on power supply) and ground (common ground).
- Set the B+ trimming potentiometer 3134 so that the reading on the DC voltmeter is 180V ± 0.5V.

2. High voltage EHT (3618)

- Turn off the power.
- Connect a "high voltage voltmeter" between the high-voltage connection of the picture tube and earth.
- Turn on the power.
- Set the contrast front control 3458 to the maximum position.
- Set H-width front control 3574 at mechanical minimum position.
- Set the EHT trimming potentiometer 3618 so that the high-voltage voltmeter reads 25kV ± 0.2kV.
- Turn off the power.
- Remove the "high voltage voltmeter" from the picture tube.
- Turn on the power again.

3. Line frequency limit adjustment (3449)

Method 1.

- Apply a video signal in the 1024*768 with 56kHz / 70Hz mode.
- Select the "cross-hatch" pattern.
- Connect an oscilloscope to pin 9 of 7403.
- Using potentiometer 3449, set the timing of pulses at pin 9 of 7403 to 2.4 ± 0.02 µs.

Method 2.

- Apply a video signal in the 60.194kHz / 70.07Hz mode (with Chroma 2000).
- Select the "cross-hatch" pattern.
- Connect a DC Voltmeter between the collector of 7422 and ground (common ground).
- Adjust the trimming potentiometer 3449 so that the reading on the DC voltmeter is 4.0 V.

Chroma 2000 timing chart for special mode 60.194kHz / 70.07Hz.

	Horizontal	Vertical
Frame border	0.000 µs	0.000 ms
Total size	16.613 µs	14.272 ms
Display size	12.800 µs	13.599 ms
Rear porche	1.920 µs	0.513 ms
Sync width	1.813 µs	0.106 ms
Sync polarity	+/-	+/-

4. Horizontal synchronisation (3411, 3654)

- Set the contrast front control 3458 to the maximum position.
- Apply a video signal in the 1024*768 with 56kHz / 70Hz mode.
- Select the "cross-hatch" pattern.
- Turn off the power.
- Short the junction of 2414 and 7406 pin 12 to ground.
- Turn on the power.
- Adjust trimming potentiometer 3411 until the picture stands straight.
- Turn off the power.
- Remove the grounding from junction of 2414 and 7406.
- Turn on the power.
- Set potentiometer 3654 for the correct horizontal centering of the whole raster.

5. Focus setting

- Apply a video signal in the 640*480 with 31.5kHz / 60Hz mode.
- Select the "M" pattern.
- Set the brightness front control 3577 to mid-position and contrast front control 3458 to maximum position.
- Adjust focus potentiometer (top knob on the line output transformer) so that the picture at 2/3 of the diagonal lines (from centre to four corners) of the displayed screen is as sharp as possible.

6. Adjustment of pre-size (3699) for "Apple-MAC"

- Apply a video signal in the 640*480 with 35.0kHz / 67Hz mode.
- Select the "cross-hatch" pattern.
- Set the brightness front control 3577 and contrast front control 3458 in the mechanical mid-position.
- Adjust the H-width to maximum by H-size front control 3574.
- Adjust the pre-size such that the picture reach to edge by 3699.

Chroma 2000 timing chart for special mode 35.0kHz / 67Hz. 640*480 pixel = 30.240MHz.

	Horizontal	Vertical
Frame border	0.000 µs	0.000 ms
Total size	28.571 µs	14.272 ms
Display size	21.164 µs	13.599 ms
Rear porche	3.175 µs	0.513 ms
Sync width	2.116 µs	0.106 ms
Sync polarity	+/-	+/-
Serration pulse	RS343A type	sync on screen
Pulse width	2.116 µs	
No. per H	1	

7. Adjustment of cut-off points

* VG2 (bottom knob on the line output transformer)
* Cut-off points of the picture tube (3378, 3383, 3388)
* White "D" (3334, 3335, 3336, 3316)

- Pre-set trimming potentiometers 3334, 3335, 3336 and 3378, 3383, 3388 to the mechanical mid-position.
- Apply a video signal (full white) in the 640*480 with 31.5kHz / 60 Hz mode.
- Set the brightness front control 3577 to the click position and contrast front control 3458 to the mechanical minimum position.
- Set VG2 potentiometer on the line output transformer to minimum position.
- Using the VG2 setting key, increase the VG2 voltage until a colour is just visible (the colour may be red, green or blue).
- Then set the cut-off points trimming potentiometer belonging to the two colours not yet visible (3378, 3383 or 3388) so that an optimum white background (raster) colour is obtained.
- Set the contrast front control 3458 to maximum in order to check that the background (raster) colour remains the same even at maximum contrast.
- Then set the contrast front control 3458 to the central position again.

7.1 White "D" (3334, 3335, 3336, 3316)

- Set the contrast front control 3458 to maximum position.
- Set the brightness front control 3577 at centre click position.
- Adjust potentiometer 3334, 3335 and 3336 to the same light output level so that an optimal display colour (white "D") is obtained.
- If necessary, adjust sub-contrast potentiometer 3316 for the optimal light output of the video display (until the brightness no longer increases).

8. Picture geometry setting

- Set brightness front control 3577 and the contrast front control 3458 in the mechanical central position.
- Apply a video signal with cross-hatch pattern in the 640*480 with 31.5kHz / 60Hz mode.

8.1 Horizontal image centering (3654, 3432)

- Set potentiometer 3654 for the correct horizontal centering of the whole raster.
- Adjust H-shift front control 3432 for the correct horizontal centering of the video display.

8.2 Horizontal width (3574)

- Adjust H-size front control 3574 for a picture width of 300mm

8.3 Vertical centering (3571)

- Adjust V-shift front control 3571 for the correct vertical centering of the video display.

8.4 Vertical height (3440)

- Adjust V-size front control 3440 for a picture height of 225mm.

8.5 East-west pincushion correction (3617)

- Adjust potentiometer 3617 until the vertical lines on the left and right-hand sides of the screen are as straight as possible.

8.6 Trapezoid correction (3614)

- Adjust potentiometer 3614 so that an optimum square cross-hatch pattern is obtained.

9. Static convergence (see Fig.)

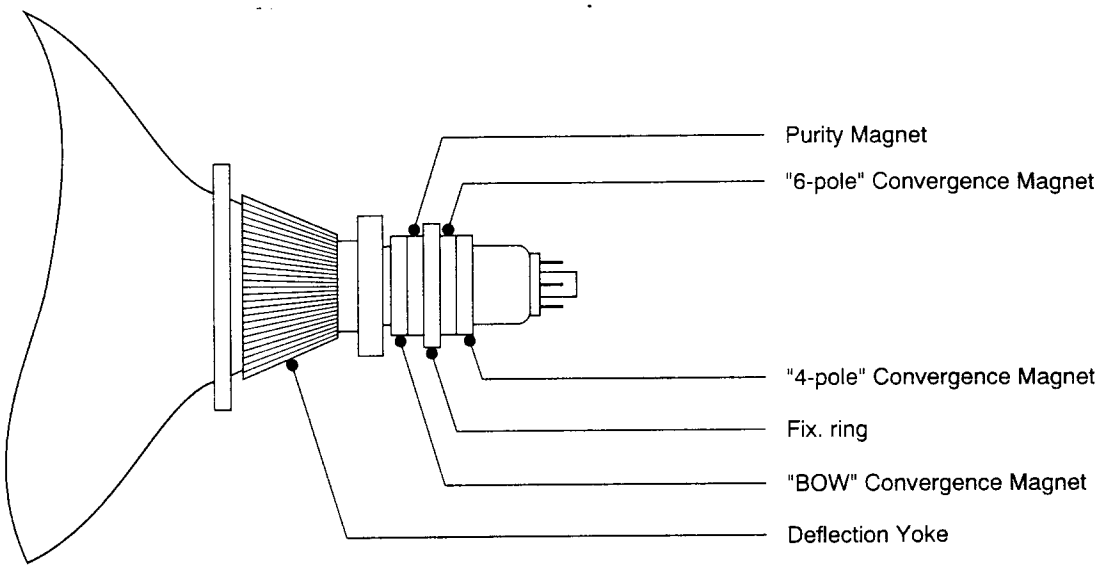
Introduction:

Slight deviation in the static convergence can be corrected by using three permanent pairs of magnets which are fitted around the neck of the picture tube. These are the 4-pole magnet and the 6-pole magnet. The 4-pole magnet move the outermost electron beams (R and B) parallel in the opposite direction from the other. The 6-pole magnet moves the outermost electron beams (R, B and G) parallel in the opposite direction from the other.
The magnetic field of the above magnets do not affect the centre of the picture tube neck.

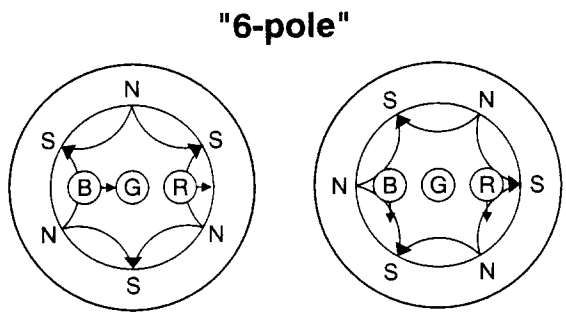
Setting:

- Before the static convergence setting can be made, the monitor must be switched on for 30 minutes.
- The focus setting must be made correctly (see focus setting).
- Signal: Cross-hatch pattern in the 1024*768 56kHz / 70Hz mode.
- Set the "tabs" of the 4-pole magnet in the neutral position.
  This is when the "tabs" are opposite one another. In this position the magnets do not affect the deflection of the "R" and "B" electron beams.
- Set the "tabs" of the 6-pole magnet in the neutral position, this is when the "tabs" are opposite one another. In this position the magnets do not affect the deflection of the "R B" and "G" electron beams.
- First set the 4-pole magnet optimally.
- Then set the 6-pole magnet optimally.
- If the convergence is not optimal now, then adjust to the optimal setting with the 4-pole magnet and then with the 6-pole magnet.

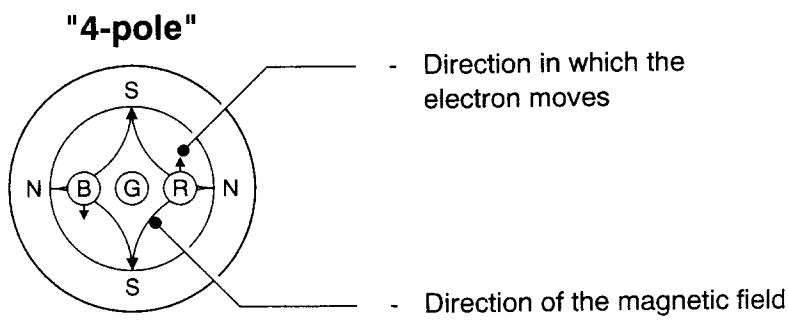
STATIC CONVERGENCE SYSTEM



"B" and "R" electron beam movement as a result of the 6-pole magnet



"B" and "R" electron beam movement as a result of the 4-pole magnet



Repair tips

Warning

All ICs and many other semi-conductors are susceptible to electrostatic discharges (ESD). Careless handling during repiar can reduce life drasticlly.
When repairing, make sure that you are connected with the same potential as the mass of the unit via a wrist wrap with resistance.

Keep components and tools also at the same potential !

1. Servicing of SMDs (Surface Mounted Devices)

1.1 General cautions on handling and storage

a. Oxidation on the terminals of SMDs results in poor soldering. Do not handle SMDs with bare hands.
b. Avoid using storage places that are sensitive to oxidation such as places with sulphur or chlorine gas, direct sunlight, high temperatures or a high degree of humidity.
The capacitance or resistance value of the SMDs may be affected by this.
c. Rough handling of circuit boards containing SMDs may cause damage to the components as well as the circuit boards. Circuit boards containing SMDs should never be bent or flexed. Different circuit board materials expand and contract at different rates when heated or cooled
and the components and/or solder connections may be damaged due to the stress. Never rub or scrape chip components as this may cause the value of the component to change. Similarly, do not slide the circuit board across any surface.

1.2 Removal of SMDs

a. Heat the solder (for 2-3 seconds) at each terminal of the chip. By means of litz wire and a slight horizontal force, small components can be removed with the soldering iron. They can also be removed with a solder sucker (see Fig. 8.1A) or:
b. While holding the SMD with a pair of tweezers, take it off gently using the soldering iron's heat applied to each terminal (see Fig. 8.1B).
c. Remove the excess solder on the solder lands by means of litz wire or a solder sucker (see Fig. 8.1C).

Caution on removal:

a. When handling the soldering iron, use suitable pressure and be careful.
b. When removing the chip, do not use undue force with the pair of tweezers.
c. The soldering iron to be used (approx. 30 W) should preferably be equipped with a thermal control (soldering temperature: 225 to 250°C).
d. The chip, once removed, must **never** be reused.

1.3 Attachment of SMDs

a. Locate the SMD on the solder lands by means of tweezers and solder the component on one side. Ensure that the component is positioned correctly on the solder lands (see Fig. 8.2A).
b. Next complete the soldering of the terminals of the component (see Fig. 8.2B).

Caution when attaching SMDs:

a. When soldering the SMD terminals, do not touch them directly with the soldering iron. The soldering should be done as quickly as possible; care must be taken to
avoid damage to the terminals of the SMDs themselves.
b. Keep the SMD's body in contact with the printed board when soldering.
c. The soldering iron to be used (approx. 30 W) should preferably be equipped with a thermal control (soldering temperature: 225 to 250°C).
d. Soldering should not be done outside the solder land.
e. Soldering flux (of rosin) may be used, but should not be acidic.
f. After soldering, let the SMD cool down gradually at room temperature.
g. The quantity of solder must be proportional to the size of the solder land. If the quantity is too great, the SMD might crack or the solder lands might be torn loose from the printed board (see Fig. 8.3).
